raytraverse is a complete workflow for climate based daylight modelling, simulation, and evaluation of architectural spaces. Built around a wavelet guided adaptive sampling strategy, raytraverse can fully explore the daylight conditions throughout a space with efficient use of processing power and storage space.

- Free software: Mozilla Public License 2.0 (MPL 2.0)
- Documentation: <https://raytraverse.readthedocs.io/en/latest/>.

## INSTALLATION

The easiest way to install raytraverse is with pip:

```
pip install --upgrade pip setuptools wheel
pip install raytraverse
```

or if you have cloned this repository:

```
cd path/to/this/file
pip install .
```

## USAGE

raytraverse includes a complete command line interface with all commands nested under the *raytraverse* parent command enter:

```
raytraverse --help
```

raytraverse also exposes an object oriented API written primarily in python. calls to Radiance are made through *Renderer* objects that wrap the radiance c source code in c++ classes, which are made available in python with *pybind11*. see the *src/* directory for more.

For complete documentation of the API and the command line interface either use the *Documentation* link included above or:

```
pip install -r docs/requirements.txt
make docs
```

to generate local documentation.

## GETTING STARTED

the following example script shows the basic workflow for a complete simulation it can be saved to a local file with:

```
raytraverse examplescript > example.py
```

or the file is located at raytraverse/example.py

## COMMAND LINE INTERFACE

The raytraverse command provides command line access to executing common tasks. The best way to manage all of the options is with a .cfg file. First, generate a template:

```
raytraverse --template > options.cfg
```

and then edit the options for each file. for example:

```
[raytraverse_scene]
out = outdir
scene = room.rad

[raytraverse_area]
ptres = 2.0
zone = plane.rad

[raytraverse_suns]
loc = weather.epw
epwloc = True

[raytraverse_skydata]
wea = weather.epw

[raytraverse_skyengine]
accuracy = 2.0
rayargs = -ab 2 -ad 4 -c 1000

[raytraverse_sunengine]
accuracy = 2.0
rayargs = -ab 2 -c 1

[raytraverse_skyrun]
accuracy = 2.0
jitter = True
nlev = 2
overwrite = False

[raytraverse_sunrun]
accuracy = 2.0
nlev = 2
srcaccuracy = 2.0
```

and then from the command line run:

```
raytraverse -c options.cfg skyrun sunrun
```

## 4.1 raytraverse

```
raytraverse [OPTIONS] COMMAND1 [ARGS]... [COMMAND2 [ARGS]...]...
```

the raytraverse executable is a command line interface to the raytraverse python package for running and evaluating climate based daylight models. sub commands of raytraverse can be chained but should be invoked in the order given.

the easiest way to manage options is to use a configuration file, to make a template:

```
raytraverse --template > run.cfg
```

after adjusting the settings, than each command can be invoked in turn and any dependencies will be loaded with the correct options, a complete run and evaluation can then be called by:

```
raytraverse -c run.cfg skyrun sunrun
```

as all required precursor commands will be invoked automatically as needed.

### Options

#### VALUE OPTIONS:

- config, -c** <PATH>  
path of config file to load
- n** <INTEGER>  
sets the environment variable RAYTRAVERSE\_PROC\_CAP set to 0 to clear (parallel processes will use cpu\_limit)
- out** <DIRECTORY>

#### FLAGS (DEFAULT FALSE):

- template, --no-template**  
write default options to std out as config  
**Default** False

#### HELP:

- opts, --opts**  
check parsed options  
**Default** False
- debug**  
show traceback on exceptions  
**Default** False
- version**  
Show the version and exit.  
**Default** False

## Commands

**scene**  
define scene files for renderer and output. . .

**area**  
define sampling area

**suns**  
define solar sampling space

**skydata**  
define sky conditions for evaluation

**skyengine**  
initialize engine for skyrun

**sunengine**  
initialize engine for sunrun

**skyrun**  
run scene under sky for a set of points. . .

**directskyrun**

**sunrun**  
run scene for a set of suns (defined by. . .

**images**  
render images

**evaluate**  
evaluate metrics

**pull**

### 4.1.1 scene

`raytraverse scene [OPTIONS]`

define scene files for renderer and output directory

## Effects

- creates outdir and outdir/scene.oct

## Options

### VALUE OPTIONS:

**-out** <DIRECTORY>

**-scene** <TEXT>

space separated list of radiance scene files (no sky) or precompiled octree

### FLAGS (DEFAULT TRUE):

**--log, --no-log**

log progress to stderr

**Default** True

**--reload, --no-reload**

if a scene already exists at OUT reload it, note that if this is False and overwrite is False, the program will abort

**Default** True

### FLAGS (DEFAULT FALSE):

**--overwrite, --no-overwrite**

Warning! if set to True all files inOUT will be deleted

**Default** False

### HELP:

**-opts, --opts**

check parsed options

**Default** False

**--debug**

show traceback on exceptions

**Default** False

**--version**

Show the version and exit.

**Default** False

## 4.1.2 area

`raytraverse area [OPTIONS]`

define sampling area

### Effects

- None

### Options

#### VALUE OPTIONS:

**-jitterrate** <FLOAT>

fraction of each axis to jitter over

**Default** 0.5

**-name** <TEXT>

name for zone/point group (impacts file naming)

**Default** plan

- printlevel** <INTEGER>  
print a set of sun positions at sampling level (overrides printdata)
- ptres** <FLOAT>  
initial sampling resolution for points  
**Default** 1.0
- rotation** <FLOAT>  
positive Z rotation for point grid alignment  
**Default** 0.0
- static\_points** <TEXT>  
points to simulate, this can be a .numpy file, a whitespace separated text file or entered as a string with commas between components of a point and spaces between points. points should either all be 3 component (x,y,z) or 6 component (x,y,z,dx,dy,dz) but the dx,dy,dz is ignored
- zheight** <FLOAT>  
replaces z in points or zone
- zone** <TEXT>  
zone boundary to dynamically sample. can either be a radiance scene file defining a plane to sample or an array of points (same input options as -static\_points). Points are used to define a convex hull with an offset of  $1/2 * ptres$  in which to sample. Note that if static\_points and zone are both give, static\_points is silently ignored

## FLAGS (DEFAULT FALSE):

- printdata, --no-printdata**  
if True, print areamapper positions (either boundary or static points)  
**Default** False

## HELP:

- opts, --opts**  
check parsed options  
**Default** False
- debug**  
show traceback on exceptions  
**Default** False
- version**  
Show the version and exit.  
**Default** False

## 4.1.3 suns

```
raytraverse suns [OPTIONS]
```

define solar sampling space

## Effects

- None

## Options

### VALUE OPTIONS:

**-jitterrate** <FLOAT>

fraction of each axis to jitter over

**Default** 0.5

**-loc** <TEXT>

can be a number of formats:

1. a string of 3 space separated values (lat lon mer) where lat is +west and mer is tz\*15 (matching gendaylit).
2. a string of comma separated sun positions with multiple items separated by spaces: "0,-.7,.7 .7,0,.7" following the shape requirements of 3.
3. a file loadable with np.loadtxt) of shape (N, 2), (N,3), (N,4), or (N,5):
  - a. 2 elements: alt, azm (angles in degrees)
  - b. 3 elements: dx,dy,dz of sun positions
  - c. 4 elements: alt, azm, dirnorm, diffhoriz (angles in degrees)
  - d. 5 elements: dx, dy, dz, dirnorm, diffhoriz.
4. path to an epw or wea formatted file: solar positions are generated and used as candidates unless -epwloc is True.
5. None (default) all possible sun positions are considered

in the case of a location, sun positions are considered valid when in the solar transit for that location. for candidate options (2., 3., 4.), sun positions are drawn from this set (with one randomly chosen from all candidates within adaptive grid.

**-name** <TEXT>

name for solar sourcee group (impacts file naming)

**Default** suns

**-printlevel** <INTEGER>

print a set of sun positions at sampling level (overrides printdata)

**-skyro** <FLOAT>

counterclockwise sky-rotation in degrees (equivalent to clockwise project north rotation)

**Default** 0.0

**-sunres** <FLOAT>

initial sampling resolution for suns

**Default** 20.0

**FLAGS (DEFAULT FALSE):****--epwloc, --no-epwloc**

if True, use location from epw/wea argument to -loc as a transit mask (like -loc option 1.) instead of as a list of candidate sun positions.

**Default** False

**--printdata, --no-printdata**

if True, print skymapper sun positions (either boundary or candidates in xyz coordinates)

**Default** False

**HELP:****-opts, --opts**

check parsed options

**Default** False

**--debug**

show traceback on exceptions

**Default** False

**--version**

Show the version and exit.

**Default** False

**4.1.4 skydata**

```
raytraverse skydata [OPTIONS]
```

define sky conditions for evaluation

**Effects**

- Invokes scene
- write outdir/name.npz (SkyData initialization object)

**Options****VALUE OPTIONS:****-ground\_fac** <FLOAT>

ground reflectance

**Default** 0.2

**-loc** <FLOATS>

location data given as 'lat lon mer' with + west of prime meridian overrides location data in wea

**-minalt** <FLOAT>

minimum solar altitude for daylight masking

**Default** 2.0

**-mindiff** <FLOAT>

minumum diffuse horizontal irradiance for daylight masking

**Default** 5.0

**-mindir** <FLOAT>  
mininum direct normal irradiance for daylight masking

**Default** 0.0

**-name** <TEXT>  
output file name for skydata

**Default** skydata

**-skyres** <FLOAT>  
approximate square patch size in degrees (must match argument given to skyengine)

**Default** 12.0

**-skyro** <FLOAT>  
angle in degrees counter-clockwise to rotate sky (to correct model north, equivalent to clockwise rotation of scene)

**Default** 0.0

**-wea** <TEXT>  
path to epw, wea, .npy file or np.array, or .npz file,if loc not set attempts to extract location data (if needed).

#### FLAGS (DEFAULT TRUE):

**--reload, --no-reload**  
reload saved skydata if it exists in scene directory

**Default** True

#### FLAGS (DEFAULT FALSE):

**--printdata, --no-printdata**  
if True, print solar position and dirnorm/diff of loaded data

**Default** False

#### HELP:

**-opts, --opts**  
check parsed options

**Default** False

**--debug**  
show traceback on exceptions

**Default** False

**--version**  
Show the version and exit.

**Default** False

## 4.1.5 skyengine

```
raytraverse skyengine [OPTIONS]
```

initialize engine for skyrun

### Effects

- Invokes scene
- creates outdir/scene\_sky.oct

### Options

#### VALUE OPTIONS:

##### **-accuracy** <FLOAT>

a generic accuracy parameter that sets the threshold variance to sample. A value of 1 will have a sample count at the final sampling level equal to the number of directions with a contribution variance greater than .25

**Default** 1.0

##### **-dcompargs** <TEXT>

additional arguments for running direct component. when using, set -ab in sunengine.rayargs to this ab minus one.

**Default** -ab 1

##### **-fdres** <INTEGER>

the final directional sampling resolution, yielding a grid of potential samples at  $2^{fdres} \times 2^{fdres}$  per hemisphere

**Default** 9

##### **-idres** <INTEGER>

the initial directional sampling resolution. each side of the sampling square (representing a hemisphere) will be subdivided  $2^{idres}$ , yielding  $2^{(2*idres)}$  samples and a resolution of  $2^{(2*idres)}/(2\pi)$  samples/steradian. this value should be smaller than 1/2 the size of the smallest view to an aperture that should be captured with 100% certainty

**Default** 5

##### **-rayargs** <TEXT>

additional arguments to pass to the rendering engine

##### **-skyres** <FLOAT>

approximate resolution for skypatch subdivision (in degrees). Patches will have (rounded) size skyres x skyres. So if skyres=10, each patch will be 100 sq. degrees (0.03046174197 steradians) and there will be  $18 * 18 = 324$  sky patches. Must match argument givein to skydata

**Default** 12.0

##### **-vlt** <FLOAT>

primary transmitting vlt, used to scale the accuracy parameter to the expected scene variance. Optional, but helpful with, for example, electrochromic glazing or shades

**Default** 0.64

**FLAGS (DEFAULT TRUE):****--default-args, --no-default-args**

use raytraverse defaults before -rayargs, if False, uses radiance defaults

**Default** True

**HELP:****-opts, --opts**

check parsed options

**Default** False

**--debug**

show traceback on exceptions

**Default** False

**--version**

Show the version and exit.

**Default** False

## 4.1.6 sunengine

`raytraverse sunengine [OPTIONS]`

initialize engine for sunrun

**Effects**

- Invokes scene

**Options****VALUE OPTIONS:****-accuracy** <FLOAT>

a generic accuracy parameter that sets the threshold variance to sample. A value of 1 will have a sample count at the final sampling level equal to the number of directions with a contribution variance greater than .25

**Default** 1.0

**-fdres** <INTEGER>

the final directional sampling resolution, yielding a grid of potential samples at  $2^{fdres} \times 2^{fdres}$  per hemisphere

**Default** 10

**-idres** <INTEGER>

the initial directional sampling resolution. each side of the sampling square (representing a hemisphere) will be subdivided  $2^{idres}$ , yielding  $2^{(2*idres)}$  samples and a resolution of  $2^{(2*idres)}/(2\pi)$  samples/steradian. this value should be smaller than 1/2 the size of the smallest view to an aperture that should be captured with 100% certainty

**Default** 5

**-maxspec** <FLOAT>

the maximum value in the specular guide considered as a specular reflection source. Above this value it is assumed that these are direct view rays to the source so are not sampled. in the case of low vlt glazing, set -vlt. In mixed (high-low) vlt scenes the specular guide will either over sample (including direct views when maxspec is large) or under sample (miss specular reflections when maxspec is small) depending on this setting.

**Default** 0.2

**-rayargs** <TEXT>

additional arguments to pass to the rendering engine

**-slimit** <FLOAT>

the minimum value in the specular guide considered as a potential specular reflection source, in the case of low vlt glazing, make sure to set -vlt.

**Default** 0.01

**-speclevel** <INTEGER>

at this sampling level, pdf is made from brightness of sky sampling rather than progressive variance to look for fine scale specular highlights, this should be atleast 1 level from the end and the resolution of this level should be smaller than the size of the source

**Default** 9

**-vlt** <FLOAT>

primary transmitting vlt, used to scale the accuracy parameter to the expected scene variance. Optional, but helpful with, for example, electrochromic glazing or shades

**Default** 0.64

**FLAGS (DEFAULT TRUE):****--default-args, --no-default-args**

use raytraverse defaults before -rayargs, if False, uses radiance defaults

**Default** True

**HELP:****-opts, --opts**

check parsed options

**Default** False

**--debug**

show traceback on exceptions

**Default** False

**--version**

Show the version and exit.

**Default** False

### 4.1.7 skyrun

```
raytraverse skyrun [OPTIONS]
```

run scene under sky for a set of points (defined by area)

#### Effects

- Invokes scene
- Invokes area (no effects)
- Invokes skyengine
- **creates outdir/area.name/sky\_points.tsv**
  - contents: 5cols x N rows: [sample\_level idx x y z]
- **creates outdir/area.name/sky/#####.rytpt**
  - each file is a LightPointKD initialization object

#### Options

##### VALUE OPTIONS:

**-accuracy** <FLOAT>

parameter to set threshold at sampling level relative to final level threshold (smaller number will increase sampling)

**Default** 1.0

**-edgemode** <CHOICE>

if 'constant' value is set to -self.t1, so edge is always seen as detail. Internal edges (resulting from Plan-Mapper borders) will behave like 'nearest' for all options except 'constant'

**Default** constant

**Options** constant | reflect | nearest | mirror | wrap

**-nlev** <INTEGER>

number of levels to sample (final resolution will be ptres/2<sup>(nlev-1)</sup>)

**Default** 3

##### FLAGS (DEFAULT TRUE):

**--jitter, --no-jitter**

jitter samples on plane within adaptive sampling grid

**Default** True

**FLAGS (DEFAULT FALSE):****--overwrite, --no-overwrite**

If True, reruns sampler when invoked, otherwise will first attempt to load results

**Default** False**--plotp, --no-plotp**

plot pdfs and sample vecs for each level

**Default** False**HELP:****-opts, --opts**

check parsed options

**Default** False**--debug**

show traceback on exceptions

**Default** False**--version**

Show the version and exit.

**Default** False**4.1.8 directskyrun**

`raytraverse directskyrun [OPTIONS]`

**Options****FLAGS (DEFAULT FALSE):****--overwrite, --no-overwrite**

If True, reruns sampler when invoked, otherwise will first attempt to load results

**Default** False**HELP:****-opts, --opts**

check parsed options

**Default** False**--debug**

show traceback on exceptions

**Default** False**--version**

Show the version and exit.

**Default** False

### 4.1.9 sunrun

```
raytraverse sunrun [OPTIONS]
```

run scene for a set of suns (defined by suns) for a set of points (defined by area)

#### Effects

- Invokes scene
- Invokes area (no effects)
- Invokes sunengine (no effects)
- invokes skyrun (if guided=True)
- **creates outdir/area.name/sun\_####\_points.tsv**
  - contents: 5cols x N rows: [sample\_level idx x y z]
- **creates outdir/area.name/sky/sun\_####/#####.rytpt**
  - each file is a LightPointKD initialization object

#### Options

##### VALUE OPTIONS:

**-accuracy** <FLOAT>

parameter to set threshold at sampling level relative to final level threshold (smaller number will increase sampling)

**Default** 1.0

**-edgemode** <CHOICE>

if 'constant' value is set to -self.t1, so edge is always seen as detail. Internal edges (resulting from Plan-Mapper borders) will behave like 'nearest' for all options except 'constant'

**Default** constant

**Options** constant | reflect | nearest | mirror | wrap

**-nlev** <INTEGER>

number of levels to sample (final resolution will be ptres/2<sup>(nlev-1)</sup>)

**Default** 3

**-srcaccuracy** <FLOAT>

parameter to set threshold at sampling level relative to final level threshold (smaller number will increase sampling)

**Default** 1.0

**-srcnlev** <INTEGER>

number of levels to sample (final resolution will be sunres/2<sup>(nlev-1)</sup>)

**Default** 3

**FLAGS (DEFAULT TRUE):****--jitter, --no-jitter**

jitter samples on plane within adaptive sampling grid

**Default** True**--recover, --no-recover**

If True, recovers existing sampling

**Default** True**--srcjitter, --no-srcjitter**

jitter solar source within adaptive sampling grid for candidate SkyMappers, only affects weighting of selecting candidates in the same grid true positions are still used

**Default** True**FLAGS (DEFAULT FALSE):****--guided, --no-guided**

If True, uses skysampling results to guide sun sampling this is necessary if the model has any specular reflections, will raise an error if skyrun has not been called yet.

**Default** False**--overwrite, --no-overwrite**

If True, reruns sampler when invoked, otherwise will first attempt to load results

**Default** False**--plotp, --no-plotp**

plot pdfs and sample vecs for each level

**Default** False**HELP:****-opts, --opts**

check parsed options

**Default** False**--debug**

show traceback on exceptions

**Default** False**--version**

Show the version and exit.

**Default** False

### 4.1.10 images

`raytraverse images [OPTIONS]`

render images

#### Prerequisites

- skyrun and sunrun must be manually invoked prior to this

#### Effects

- Invokes scene
- Invokes skydata
- invokes area (no effects)
- invokes suns (no effects)
- writes: output images according to `-namebyindex`

#### Options

##### VALUE OPTIONS:

**-basename** <TEXT>

prefix of namebyindex.

**Default** results

**-interpolate** <CHOICE>

**Options** linear | fast | high | None | False

**-res** <INTEGER>

image resolution

**Default** 800

**-resamprad** <FLOAT>

radius for resampling sun vecs

**Default** 0.0

**-resuntol** <FLOAT>

tolerance for resampling sun views

**Default** 1.0

**-sdirs** <TEXT>

sensor directions, this can be a .npz file, a whitespace separated text file or entered as a string with commas between components of a point and spaces between points. vectors should all be 3 component (dx,dy,dz). used with 3-component -sensors argument, all points are run for all views, creating len(sensors)\*len(sdirs) results. this is the preferred option for multiple view directions, as the calculations are grouped more efficiently

**-sensors** <TEXT>

sensor points, this can be a .npz file, a whitespace separated text file or entered as a string with commas between components of a point and spaces between points. points should either all be 3 component (x,y,z) or 6 component (x,y,z,dx,dy,dz). If 3 component, -sdirs is required, if 6-component, -sdirs is ignored

**-simtype** <CHOICE>

simulation process/integration type:

- 1comp: standard DC method, sky patch only, full contribution depending on skyengine settings
- 2comp: sky patch for sky contribution, sun run for sun contribution, depth of contributions depends on skyengine and sunengine settings, no approximation for sun from sky patch
- 3comp: 2-phase DDS, sky handles sky+indirect sun, sun handles direct sun requires directskyrun -ab 1 and sunrun -ab 0
- 1compdv: standar DC method, but with direct view replacement of sun and specular reflections
- directview: only evaluate srcviewpts (direct views to sun and specular reflections)
- directpatch: only evaluate results from dskyrun
- sunonly: only evaluate results from sunrun
- sunpatch: use skyrun results to evaluate sun contribution
- skyonly: use skyrun to evaluate sky contribution only

**Default** 3comp

**Options** 1comp | 2comp | 3comp | 1compdv | directview | directpatch | sunonly | sunpatch | skyonly

**-skymask** <INTS>

mask to reduce output from full SkyData, enter as index rows in wea/epw file using space seperated list or python range notation:

- 370 371 372 (10AM-12PM on jan. 16th)
- 12:8760:24 (everyday at Noon)

**-viewangle** <FLOAT>

**Default** 180.0

## FLAGS (DEFAULT TRUE):

**--maskfull, --maskday**

if false, skymask assumes daystep indices

**Default** True

## FLAGS (DEFAULT FALSE):

**--blursun, --no-blursun**

for simulating point spread function for direct sun view

**Default** False

**--directview, --no-directview**

if True, ignore sky data and use daylight factors directly

**Default** False

**--namebyindex, --no-namebyindex**

if False (default), names images by: <prefix>\_sky-<row>\_pt-<x>\_<y>\_<z>\_vd-<dx>\_<dy>\_<dz>.hdr if True, names images by: <prefix>\_sky-<row>\_pt-<pidx>\_vd-<vidx>.hdr, where pidx, vidx refer to the order of points, and vm.

**Default** False

**--resampleview, --no-resampleview**

resample direct sun view directions

**Default** False

**HELP:****-opts, --opts**

check parsed options

**Default** False**--debug**

show traceback on exceptions

**Default** False**--version**

Show the version and exit.

**Default** False

### 4.1.11 evaluate

```
raytraverse evaluate [OPTIONS]
```

evaluate metrics

**Prerequisites**

- skyrun and sunrun must be manually invoked prior to this

**Effects**

- Invokes scene
- Invokes skydata
- invokes area (no effects)
- invokes suns (no effects)
- writes: <basename>.npz light result file (use “raytraverse pull” to extract data views)

**Options****VALUE OPTIONS:****-basename** <TEXT>

LightResult object is written to basename.npz.

**Default** results**-metrics** <TEXTS>

metrics to compute, choices: [“illum”, “avglum”, “gcr”, “ugp”, “dgp”, “tasklum”, “backlum”, “dgp\_t1”, “log\_gc”, “dgp\_t2”, “ugr”, “threshold”, “pws12”, “view\_area”, “backlum\_true”, “srcillum”, “srcarea”, “maxlum”]

**Default** illum dgp ugp**-resamprad** <FLOAT>

radius for resampling sun vecs

**Default** 0.0**-resuntol** <FLOAT>

tolerance for resampling sun views

**Default** 1.0

**-sdirs** <TEXT>

sensor directions, this can be a .npy file, a whitespace separated text file or entered as a string with commas between components of a point and spaces between points. vectors should all be 3 component (dx,dy,dz). used with 3-component -sensors argument, all points are run for all views, creating len(sensors)\*len(sdirs) results. this is the preferred option for multiple view directions, as the calculations are grouped more efficiently

**-sensors** <TEXT>

sensor points, this can be a .npy file, a whitespace separated text file or entered as a string with commas between components of a point and spaces between points. points should either all be 3 component (x,y,z) or 6 component (x,y,z,dx,dy,dz). If 3 component, -sdirs is required, if 6-component, -sdirs is ignored

**-simtype** <CHOICE>

simulation process/integration type:

- 1comp: standard DC method, sky patch only, full contribution depending on skyengine settings
- 2comp: sky patch for sky contribution, sun run for sun contribution, depth of contributions depends on skyengine and sunengine settings, no approximation for sun from sky patch
- 3comp: 2-phase DDS, sky handles sky+indirect sun, sun handles direct sun requires directskyrun -ab 1 and sunrun -ab 0
- 1compdv: standard DC method, but with direct view replacement of sun and specular reflections
- directview: only evaluate srcviewpts (direct views to sun and specular reflections)
- directpatch: only evaluate results from dskyrun
- sunonly: only evaluate results from sunrun
- sunpatch: use skyrun results to evaluate sun contribution
- skyonly: use skyrun to evaluate sky contribution only

**Default** 3comp

**Options** 1comp | 2comp | 3comp | 1compdv | directview | directpatch | sunonly | sunpatch | skyonly

**-skymask** <INTS>

mask to reduce output from full SkyData, enter as index rows in wea/epw file using space separated list or python range notation:

- 370 371 372 (10AM-12PM on Jan. 16th)
- 12:8760:24 (everyday at Noon)

**-threshold** <FLOAT>

same as the evalglare -b option. if factor is larger than 100, it is used as constant threshold in cd/m<sup>2</sup>, else this factor is multiplied by the average task luminance. task position is center of image with a 30 degree field of view

**Default** 2000.0

**-viewangle** <FLOAT>

**Default** 180.0

### FLAGS (DEFAULT TRUE):

**--maskfull, --maskday**

if false, skymask assumes daystep indices

**Default** True

**--npz, --no-npz**

write LightResult object to .npz, use 'raytraverse pull' or LightResult('basename.npz') to access results

**Default** True

### FLAGS (DEFAULT FALSE):

**--blursun, --no-blursun**

for simulating point spread function for direct sun view

**Default** False

**--coercesumsafe, --no-coercesumsafe**

to speed up evaluation, treat sources separately, only compatible with illum, avglum, ugp (but note this is often WRONG!!!), dgp

**Default** False

**--lowlight, --no-lowlight**

use lowlight correction for dgp

**Default** False

**--resampleview, --no-resampleview**

resample direct sun view directions

**Default** False

**--serr, --no-serr**

include columns of sampling info/errors columns are: sun\_pt\_err, sun\_pt\_bin, sky\_pt\_err, sky\_pt\_bin, sun\_err, sun\_bin. 'err' is distance from queried vector to actual. 'bin' is the unraveled idx of source vector at a 500^2 resolution of the mapper.

**Default** False

### HELP:

**-opts, --opts**

check parsed options

**Default** False

**--debug**

show traceback on exceptions

**Default** False

**--version**

Show the version and exit.

**Default** False

### 4.1.12 pull

```
raytraverse pull [OPTIONS]
```

#### Options

##### VALUE OPTIONS:

**-col** <TEXTS>

axis to preserve and order for flattening, if not all axes are specified default order is (sky, point, view, metric) the first value is the column preserved, the second (with -ofiles) is the file to write, and the rest determine the order for ravelling into rows.

**Default** metric

**-imgfilter** <INTS>

image indices to return (ignored for lightfield result)

**-imgzone** <TEXT>

for making images from ZonalLightResult, path to areato sample over.

**-lr** <FILE>

.npz LightResult, overrides lightresult from chained commands (evaluate/imgmetric). required if not chained with evaluate or imgmetric.

**-metricfilter** <TEXTS>

metrics to return (non-existent are ignored)

**-ofiles** <TEXT>

if given output serialized files along first axis (given by order) with naming [ofiles]\_XXXX.txt

**-ptfilter** <INTS>

point indices to return (ignored for imgmetric result)

**-skyfill** <FILE>

path to skydata file. assumes rows are timesteps. skyfilter should be None and other beside col should reduce to 1 or ofiles is given and sky is not first in order and all but first reduces to 1. LightResult should be a full evaluation (not masked)

**-skyfilter** <INTS>

sky indices to return (ignored for imgmetric result)

**-spd** <INTEGER>

steps per day. for use with -gridhdr col != sky matches data underlying -skyfill

**Default** 24

**-viewfilter** <INTS>

view direction indices to return (ignored for imgmetric result)

##### FLAGS (DEFAULT TRUE):

**--header, --no-header**

print col labels

**Default** True

**--rowlabel, --no-rowlabel**

label row

**Default** True

**FLAGS (DEFAULT FALSE):****--gridhdr, --no-gridhdr**

use with 'ofiles', order 'X point/sky Y' and make sure Y only has one value (with appropriate filter)

**Default** False**--info, --no-info**

skip execution and return shape and axis info about LightResult

**Default** False**HELP:****-opts, --opts**

check parsed options

**Default** False**--debug**

show traceback on exceptions

**Default** False**--version**

Show the version and exit.

**Default** False

## 4.2 raytu

```
raytu [OPTIONS] COMMAND1 [ARGS]... [COMMAND2 [ARGS]...]...
```

the raytu executable is a command line interface to utility commands as part of the raytraverse python package.

the easiest way to manage options is to use a configuration file, to make a template:

```
raytu --template > run.cfg
```

after adjusting the settings, than each command can be invoked in turn and any dependencies will be loaded with the correct options, for example:

```
raytraverse -c run.cfg imgmetric pull
```

will calculate metrics on a set of images and then print to the stdout.

### Options

**VALUE OPTIONS:****-config, -c <PATH>**

path of config file to load

**-n <INTEGER>**

sets the environment variable RAYTRAVERSE\_PROC\_CAP set to 0 to clear (parallel processes will use cpu\_limit)

**FLAGS (DEFAULT FALSE):**

**--template, --no-template**  
 write default options to std out as config  
**Default** False

**HELP:**

**-opts, --opts**  
 check parsed options  
**Default** False

**--debug**  
 show traceback on exceptions  
**Default** False

**--version**  
 Show the version and exit.  
**Default** False

**Commands**

**transform**  
 coordinate transformations

**imgmetric**  
 calculate metrics for hdr images, similar...

**img21f**  
 read and compress angular fisheye images...

**pull**

**padsky**  
 pad filtered result data according to sky...

**4.2.1 transform**

```
raytu transform [OPTIONS]
```

coordinate transformations

**Options****VALUE OPTIONS:**

**-cols** <INTS>  
 coordinate columns (if none uses first N as required)

**-d** <TEXT>  
 a .npy file, a whitespace separated text file (can be - for stdin) or entered as a string with commas between components of a point and spaces between rows.

**-op** <CHOICE>  
 transformation: 'xyz2xy': cartesian direction vector to equiangular. 'xyz2aa': cartesian direction vector to alt/azimuth. 'xyz2tp': cartesian to spherical (normalized). 'xyz2uv': cartesian to shirley-chiu square. 'uv2xyz': shirley-chiu square to cartesian.

**Default** xyz2xy

**Options** xyz2xy | xyz2aa | xyz2tp | xyz2uv | uv2xyz

**-outf** <TEXT>

if none, return to stdout, else save as text file

**-reshape** <INTS>

reshape before transform (before flip)

## FLAGS (DEFAULT FALSE):

**--flip, --no-flip**

transpose matrix before transform (after reshape)

**Default** False

## HELP:

**-opts, --opts**

check parsed options

**Default** False

**--debug**

show traceback on exceptions

**Default** False

**--version**

Show the version and exit.

**Default** False

## 4.2.2 imgmetric

`raytu imgmetric [OPTIONS]`

calculate metrics for hdr images, similar to evalglare but without glare source grouping, equivalent to -r 0 in evalglare. This ensures that all glare source positions are weighted by the metrics to which they are applied. Additional peak normalization reduces the deviation between images processed in different ways, for example pfilt with -r, rpict drawsource(), or an undersampled vwrays | rtrace run where the pixels give a coarse estimate of the actual sun area.

### Options

#### VALUE OPTIONS:

**-basename** <TEXT>

LightResult object is written to basename.npz.

**Default** img\_metrics

**-imgs** <FILES>

hdr image files, must be angular fisheye projection, if no view in header, assumes 180 degree

**-metrics** <TEXTS>

metrics to compute, choices: ["illum", "avglum", "gcr", "ugp", "dgp", "tasklum", "backlum", "dgp\_t1", "log\_gc", "dgp\_t2", "ugr", "threshold", "pws12", "view\_area", "backlum\_true", "srcillum", "srcarea", "maxlum"]

**Default** illum dgp ugp

**-peaka** <FLOAT>

expected peak area over which peak energy is distributed

**Default** 6.7967e-05

**-peakr** <FLOAT>

for peaks that do not meet expected area (such as partial suns, to determines the ratio of what counts as part of the source (max/peakr)

**Default** 4.0

**-peakt** <FLOAT>

include down to this threshold in possible peak, note that once expected peak energy is satisfied remaining pixels are maintained, so it is safe-ish to keep this value low

**Default** 100000.0

**-scale** <FLOAT>

scale factor applied to pixel values to convert to cd/m<sup>2</sup>

**Default** 179.0

**-threshold** <FLOAT>

same as the evalglare -b option. if factor is larger than 100, it is used as constant threshold in cd/m<sup>2</sup>, else this factor is multiplied by the average task luminance. task position is center of image with a 30 degree field of view

**Default** 2000.0

## FLAGS (DEFAULT TRUE):

**--npz, --no-npz**

write LightResult object to .npz, use 'raytraverse pull' or LightResult('basename.npz') to access results

**Default** True

**--parallel, --no-parallel**

use available cores

**Default** True

**--peakn, --no-peakn**

correct aliasing and/or filtering artifacts for direct sun by assigning up to expected energy to peakarea

**Default** True

## FLAGS (DEFAULT FALSE):

**--blursun, --no-blursun**

applies human PSF to peak glare source (only if peekn=True

**Default** False

**--lowlight, --no-lowlight**

use lowlight correction for dgp

**Default** False

## HELP:

- opts, --opts**  
check parsed options  
**Default** False
- debug**  
show traceback on exceptions  
**Default** False
- version**  
Show the version and exit.  
**Default** False

## 4.2.3 img2lf

```
raytu img2lf [OPTIONS]
```

read and compress angular fisheye images into lightpoints/lightplane

## Options

### VALUE OPTIONS:

- imga** <FILES>  
hdr image files, primary view direction, must be angular fisheye projection, view header required
- imgb** <FILES>  
hdr image files, opposite view direction, must be angular fisheye projection, assumed to be same as imga with -vd reversed
- out** <DIRECTORY>  
output directory  
**Default** imglf

## HELP:

- opts, --opts**  
check parsed options  
**Default** False
- debug**  
show traceback on exceptions  
**Default** False
- version**  
Show the version and exit.  
**Default** False

## 4.2.4 pull

```
raytu pull [OPTIONS]
```

### Options

#### VALUE OPTIONS:

**-col** <TEXTS>

axis to preserve and order for flattening, if not all axes are specified default order is (sky, point, view, metric) the first value is the column preserved, the second (with -ofiles) is the file to write, and the rest determine the order for ravelling into rows.

**Default** metric

**-imgfilter** <INTS>

image indices to return (ignored for lightfield result)

**-imgzone** <TEXT>

for making images from ZonalLightResult, path to areato sample over.

**-lr** <FILE>

.npz LightResult, overrides lightresult from chained commands (evaluate/imgmetric). required if not chained with evaluate or imgmetric.

**-metricfilter** <TEXTS>

metrics to return (non-existent are ignored)

**-ofiles** <TEXT>

if given output serialized files along first axis (given by order) with naming [ofiles]\_XXXX.txt

**-ptfilter** <INTS>

point indices to return (ignored for imgmetric result)

**-skyfill** <FILE>

path to skydata file. assumes rows are timesteps. skyfilter should be None and other beside col should reduce to 1 or ofiles is given and sky is not first in order and all but first reduces to 1. LightResult should be a full evaluation (not masked)

**-skyfilter** <INTS>

sky indices to return (ignored for imgmetric result)

**-spd** <INTEGER>

steps per day. for use with -gridhdr col != sky matches data underlying -skyfill

**Default** 24

**-viewfilter** <INTS>

view direction indices to return (ignored for imgmetric result)

#### FLAGS (DEFAULT TRUE):

**--header, --no-header**

print col labels

**Default** True

**--rowlabel, --no-rowlabel**

label row

**Default** True

### FLAGS (DEFAULT FALSE):

**--gridhdr, --no-gridhdr**

use with 'ofiles', order 'X point/sky Y' and make sure Y only has one value (with appropriate filter)

**Default** False

**--info, --no-info**

skip execution and return shape and axis info about LightResult

**Default** False

### HELP:

**-opts, --opts**

check parsed options

**Default** False

**--debug**

show traceback on exceptions

**Default** False

**--version**

Show the version and exit.

**Default** False

## 4.2.5 padsky

`raytu padsky [OPTIONS]`

pad filtered result data according to sky filtering

### Options

#### VALUE OPTIONS:

**-cols** <INTS>

cols of data to return (default all)

**-data** <TEXT>

data to pad

**-loc** <FLOATS>

location data given as 'lat lon mer' with + west of prime meridian overrides location data in wea

**-minalt** <FLOAT>

minimum solar altitude for daylight masking

**Default** 2.0

**-mindiff** <FLOAT>

mininum diffuse horizontal irradiance for daylight masking

**Default** 5.0

**-mindir** <FLOAT>

mininum direct normal irradiance for daylight masking

**Default** 0.0

**-wea** <TEXT>

path to epw, wea, .npy file or np.array, or .npz file, if loc not set attempts to extract location data (if needed).

## HELP:

**-opts, --opts**

check parsed options

**Default** False

**--debug**

show traceback on exceptions

**Default** False

**--version**

Show the version and exit.

**Default** False

## 4.3 raytraverse.scene

### 4.3.1 BaseScene

```
class raytraverse.scene.BaseScene(outdir, scene=None, frozen=True, formatter=<class
    'raytraverse.formatter.formatter.Formatter'>,
    reload=True, overwrite=False, log=True, loglevel=10,
    utc=False)
```

Bases: object

container for scene description

#### Parameters

- **outdir** (*str*) – path to store scene info and output files
- **scene** (*str, optional (required if not reload)*) – space separated list of radiance scene files (no sky) or octree
- **frozen** (*bool, optional*) – create a frozen octree
- **formatter** (*raytraverse.formatter.Formatter, optional*) – intended renderer format
- **reload** (*bool, optional*) – if True attempts to load existing scene files in new instance overrides ‘overwrite’
- **overwrite** (*bool, optional*) – if True and outdir exists, will overwrite, else raises a `FileExistsError`
- **log** (*bool, optional*) – log progress events to outdir/log.txt
- **loglevel** (*int, optional*) – maximum sampler level to log

#### property scene

render scene files (octree)

**Getter** Returns this samplers’s scene file path

**Setter** Sets this samplers’s scene file path and creates run files

**Type** str

**log** (*instance, message, err=False, level=0*)

print a message to the log file or stderr

**Parameters**

- **instance** (*Any*) – the parent class for the progress bar
- **message** (*str*, *optional*) – the message contents
- **err** (*bool*, *optional*) – print to stderr instead of self.\_logf
- **level** (*int*, *optional*) – the nested level of the message

**progress\_bar** (*instance*, *iterable=None*, *message=None*, *total=None*, *level=0*, *workers=False*)  
generate a tqdm progress bar and concurrent.futures Executor class

**Parameters**

- **instance** (*Any*) – the parent class for the progress bar
- **iterable** (*Sequence*, *optional*) – passed to tqdm, the sequence to loop over
- **message** (*str*, *optional*) – the prefix message for the progress bar
- **total** (*int*, *optional*) – the number of expected iterations (when iterable is none)
- **level** (*int*, *optional*) – the nested level of the progress bar
- **workers** (*Union[bool, str]*, *optional*) – if “thread/threads/t” returns a ThreadPoolExecutor, else if True returns a ProcessPoolExecutor.

**Returns** a subclass of tqdm that decorates messages and has a pool property for multiprocessing.

**Return type** *TStqdm*

**Examples**

with an iterable:

```
for i in self.scene.progress_bar(self, np.arange(10)):  
    do stuff...
```

with workers=True:

```
with self.scene.progress_bar(self, total=len(jobs) workers=True) as pbar: exc =  
    pbar.pool do stuff... pbar.update(1)
```

## 4.3.2 Scene

```
class raytraverse.scene.Scene(outdir, scene=None, frozen=True, formatter=<class 'ray-  
traverse.formatter.radianceformatter.RadianceFormatter'>,  
                             **kwargs)
```

Bases: raytraverse.scene.basescene.BaseScene

container for radiance scene description

WARNING!! if scene parameter contains and instance primitive, sunsampler will throw a segmentation fault when it tries to change the source. As scene instantiation will make a frozen octree, it is better to feed complete scene description files, or an octree.

**Parameters**

- **outdir** (*str*) – path to store scene info and output files
- **formatter** (*raytraverse.formatter.RadianceFormatter*, *optional*) – intended renderer format

### 4.3.3 ImageScene

**class** raytraverse.scene.**ImageScene** (*outdir, scene=None, reload=True, log=False*)

Bases: raytraverse.scene.basescene.BaseScene

scene for image sampling

#### Parameters

- **outdir** (*str*) – path to store scene info and output files
- **scene** (*str, optional*) – image file (hdr format -vta projection)

## 4.4 raytraverse.mapper

### 4.4.1 Mapper

**class** raytraverse.mapper.**Mapper** (*dxyz=0.0, 0.0, 1.0, sf=1, 1, bbox=0, 0, 1, 1, aspect=None, name='mapper', origin=0, 0, 0, jitterrate=1.0*)

Bases: object

translate between world and normalized UV space. do not use directly, instead use an inheriting class.

#### Parameters

- **sf** (*tuple np.array, optional*) – scale factor for each axis (array of length(2))
- **bbox** (*tuple np.array, optional*) – bounding box for mapper shape (2, 2)
- **name** (*str, optional*) – used for output file naming

**property aspect**

**property dxyz**

(float, float, float) central view direction

**property bbox**

bounding box of view

**Type** np.array of shape (2,2)

**view2world** (*xyz*)

rotate vectors from view direction to world Z

**world2view** (*xyz*)

rotate vectors from world Z to view direction

**xyz2uv** (*xyz*)

transform from world xyz space to mapper UV space

**uv2xyz** (*uv, stackorigin=False*)

transform from mapper UV space to world xyz

**idx2uv** (*idx, shape, jitter=True*)

#### Parameters

- **idx** (*flattened index*) –
- **shape** – the shape to unravel into
- **jitter** (*bool, optional*) – randomly offset coordinates within grid

**Returns** *uv* – uv coordinates

**Return type** np.array

**static** **uv2idx** (*uv, shape*)

**xyz2vxy** (*xyz*)  
transform from world xyz to view image space (2d)

**vxy2xyz** (*xy*, *stackorigin=False*)  
transform from view image space (2d) to world xyz

**framesize** (*res*)

**pixels** (*res*)  
generate pixel coordinates for image space

**pixelrays** (*res*)  
world xyz coordinates for pixels in view image space

**ray2pixel** (*xyz*, *res*, *integer=True*)  
world xyz to pixel coordinate

**pixel2ray** (*pxy*, *res*)  
pixel coordinate to world xyz vector

**pixel2omega** (*pxy*, *res*)  
pixel area

**in\_view** (*vec*, *indices=True*)  
generate mask for vec that are in the field of view

**header** (*\*\*kwargs*)

**init\_img** (*res=512*, *\*\*kwargs*)  
Initialize an image array with vectors and mask

#### Parameters

- **res** (*int*, *optional*) – image array resolution
- **kwargs** – passed to self.header

#### Returns

- **img** (*np.array*) – zero array of shape (res, res)
- **vecs** (*np.array*) – direction vectors corresponding to each pixel (img.size, 3)
- **mask** (*np.array*) – indices of flattened img that are in view
- **mask2** (*np.array None*) –  
if ViewMapper has inverse, mask for opposite view, usage:

```
add_to_img(img, vecs[mask], mask)
add_to_img(img[res:], vecs[res:][mask2], mask2)
```

- **header** (*str*)

**add\_vecs\_to\_img** (*img*, *v*, *channels=1*, *0*, *0*, *grow=0*, *\*\*kwargs*)

**plot** (*xyz*, *outf*, *res=1000*, *grow=1*, *\*\*kwargs*)

## 4.4.2 AngularMixin

**class** raytraverse.mapper.angularmixin.**AngularMixin**

Bases: object

includes overrides of transformation functions for angular type mapper classes. Inherit before raytraverse.mapper.Mapper eg:

```
NewMapper(AngularMixin, Mapper)
```

initialization of NewMapper must include declarations of:

```
self._viewangle = viewangle
self._chordfactor = chordfactor
self._ivm = ivm
```

**xyz2uv** (xyz)

transform from world xyz space to mapper UV space

**uv2xyz** (uv, stackorigin=False)

transform from mapper UV space to world xyz

**xyz2vxy** (xyz)

transform from world xyz to view image space (2d)

**vxy2xyz** (xy, stackorigin=False)

transform from view image space (2d) to world xyz

**static framesize** (res)

**pixelrays** (res)

world xyz coordinates for pixels in view image space

**pixel2omega** (pxy, res)

pixel solid angle

**in\_view** (vec, indices=True, tol=0.0)

generate mask for vec that are in the field of view (up to 180 degrees) if view aspect is 2, only tests against primary view direction

**header** (pt=0, 0, 0, \*\*kwargs)

**init\_img** (res=512, pt=0, 0, 0, \*\*kwargs)

Initialize an image array with vectors and mask

### Parameters

- **res** (int, optional) – image array resolution
- **pt** (tuple, optional) – view point for image header

### Returns

- **img** (np.array) – zero array of shape (res\*self.aspect, res)
- **vecs** (np.array) – direction vectors corresponding to each pixel (img.size, 3)
- **mask** (np.array) – indices of flattened img that are in view
- **mask2** (np.array None) –  
if ViewMapper is 360 degree, include mask for opposite view to use:

```
add_to_img(img, vecs[mask], mask)
add_to_img(img[res:], vecs[res:][mask2], mask2)
```

- **header** (str)

**add\_vecs\_to\_img** (img, v, channels=1, 0, 0, grow=0, fisheye=True)

**property viewangle**

view angle

**property ivm**

viewmapper for opposite view direction (in case of 360 degree view)

**ctheta** (*vec*)

cos(theta) (dot product) between view direction and vec

**radians** (*vec*)

angle in radians between view direction and vec

**degrees** (*vec*)

angle in degrees between view direction and vec

### 4.4.3 ViewMapper

**class** raytraverse.mapper.**ViewMapper** (*dxyz=0.0, 1.0, 0.0, viewangle=360.0, name='view', origin=0, 0, 0, jitterrate=0.9*)

Bases: raytraverse.mapper.angularmixin.AngularMixin, raytraverse.mapper.mapper.Mapper

translate between world direction vectors and normalized UV space for a given view angle. pixel projection yields equiangular projection

#### Parameters

- **dxyz** (*tuple, optional*) – central view direction
- **viewangle** (*float, optional*) – if < 180, the horizontal and vertical view angle, if greater, view becomes 360,180

**property aspect**

**property dxyz**

(float, float, float) central view direction

**idx2uv** (*idx, shape, jitter=True*)

#### Parameters

- **idx** (*flattened index*) –
- **shape** – the shape to unravel into
- **jitter** (*bool, optional*) – randomly offset coordinates within grid

**Returns** uv – uv coordinates

**Return type** np.array

### 4.4.4 SkyMapper

**class** raytraverse.mapper.**SkyMapper** (*loc=None, skyro=0.0, sunres=20.0, name='sky', jitterrate=0.5*)

Bases: raytraverse.mapper.angularmixin.AngularMixin, raytraverse.mapper.mapper.Mapper

translate between world direction vectors and normalized UV space for a given view angle. pixel projection yields equiangular projection

#### Parameters

- **loc** (*any, optional*) – can be a number of formats:
  1. either a numeric iterable of length 3 (lat, lon, mer) where lat is +west and mer is tz\*15 (matching gendaylit).

2. an array (or tsv file loadable with `np.loadtxt`) of shape (N,3), (N,4), or (N,5):
  - a. 2 elements: alt, azm (angles in degrees)
  - b. 3 elements: dx,dy,dz of sun positions
  - c. 4 elements: alt, azm, dirnorm, diffhoriz (angles in degrees)
  - d. 5 elements: dx, dy, dz, dirnorm, diffhoriz.
3. path to an epw or wea formatted file
4. None (default) all possible sun positions are considered `self.in_solarbounds` always returns True

in the case of a geo location, sun positions are considered valid when in the solar transit for that location. for candidate options, sun positions are drawn from this set (with one randomly chosen from all candidates within bin.

- **skyro** (*float, optional*) – counterclockwise sky-rotation in degrees (equivalent to clockwise project north rotation)
- **sunres** (*float, optional*) – initial sampling resolution for suns
- **name** (*str, optional*) –

**property skyro**

**property sunres**

**property loc**

**property solarbounds**

**property candidates**

**in\_solarbounds** (*xyz, level=0, include='center'*)  
for checking if src direction is in solar transit

#### Parameters

- **xyz** (*np.array*) – source directions
- **level** (*int*) – for determining patch size,  $2^{**level}$  resolution from sunres
- **include** (*{'center', 'all', 'any'}, optional*) – boundary test condition. 'center' tests uv only, 'all' requires for corners of box centered at uv to be in, 'any' requires atleast one corner. 'any' is the least restrictive and 'all' is the most, but with increasing levels 'any' will exclude more positions while 'all' will exclude less (both approaching 'center' as level  $\rightarrow N$ )

**Returns result** – Truth of ray.src within solar transit

**Return type** np.array

**shape** (*level=0*)

**solar\_grid** (*jitter=True, level=0, masked=True*)  
generate a grid of solar positions

#### Parameters

- **jitter** (*bool, optional*) – if None, use the instance default, if True jitters point samples within stratified grid
- **level** (*int, optional*) – sets the resolution of the grid as a power of 2 from sunress
- **masked** (*bool, optional*) – apply `in_solarbounds` to suns before returning

**Returns** shape (N, 3)

**Return type** np.array

### 4.4.5 PlanMapper

```
class raytraverse.mapper.PlanMapper (area, ptres=1.0, rotation=0.0, zheight=None,  
                                     name='plan', jitterrate=0.5, autorotate=False,  
                                     autogrid=None)
```

Bases: raytraverse.mapper.mapper.Mapper

translate between world positions on a horizontal plane and normalized UV space for a given view angle.  
pixel projection yields a parallel plan projection

#### Parameters

- **area** (*str np.array, optional*) – radiance scene geometry defining a plane to sample, tsv file of points to generate bounding box, or np.array of points.
- **ptres** (*float, optional*) – resolution for considering points duplicates, border generation (1/2) and add\_grid(). updateable
- **rotation** (*float, optional*) – positive Z rotation for point grid alignment
- **zheight** (*float, optional*) – override calculated zheight
- **name** (*str, optional*) – plan mapper name used for output file naming
- **jitterrate** (*float, optional*) – proportion of cell to jitter within
- **autorotate** (*bool, optional*) – if true set rotation based on long axis of area geometry
- **autogrid** (*int, optional*) – if given, autoset ptres based on this minimum number of points at level 0 along the minimum dimemsion (width or height)

**ptres = None**

point resolution for area look ups and grid

**Type** float

**property dxyz**

(float, float, float) central view point

**property rotation**

ccw rotation (in degrees) for point grid on plane

**Type** float

**property bbox**

boundary frame for translating between coordinates [[xmin ymin zmin] [xmax ymax zmax]]

**Type** np.array

**update\_bbox** (*plane, level=0, updatez=True*)

handle bounding box generation from plane or points

**uv2xyz** (*uv, stackorigin=False*)

transform from mapper UV space to world xyz

**in\_view\_uv** (*uv, indices=True, \*\*kwargs*)

**in\_view** (*vec, indices=True*)

check if point is in boundary path

#### Parameters

- **vec** (*np.array*) – xyz coordinates, shape (N, 3)
- **indices** (*bool, optional*) – return indices of True items rather than boolean array

**Returns** **mask** – boolean array, shape (N,)

**Return type** np.array

**borders** ()

world coordinate vertices of planmapper boundaries

**bbox\_vertices** (*offset=0, close=False*)

**shape** (*level=0*)

**point\_grid** (*jitter=True, level=0, masked=True, snap=None*)

generate a grid of points

#### Parameters

- **jitter** (*bool, optional*) – if None, use the instance default, if True jitters point samples within stratified grid
- **level** (*int, optional*) – sets the resolution of the grid as a power of 2 from ptres
- **masked** (*bool, optional*) – apply in\_view to points before returning
- **snap** (*int, optional*) – level to snap samples to when jitter=False should be > level

**Returns** shape (N, 3)

**Return type** np.array

**point\_grid\_uv** (*jitter=True, level=0, masked=True, snap=None*)

add a grid of UV coordinates

#### Parameters

- **jitter** (*bool, optional*) – if None, use the instance default, if True jitters point samples within stratified grid
- **level** (*int, optional*) – sets the resolution of the grid as a power of 2 from ptres
- **masked** (*bool, optional*) – apply in\_view to points before returning
- **snap** (*int, optional*) – level to snap samples to when jitter=False should be > level

**Returns** shape (N, 2)

**Return type** np.array

## 4.4.6 MaskedPlanMapper

**class** raytraverse.mapper.**MaskedPlanMapper** (*pm, valid, level*)

Bases: raytraverse.mapper.planmapper.PlanMapper

translate between world positions on a horizontal plane and normalized UV space for a given view angle. pixel projection yields a parallel plan projection

#### Parameters

- **pm** (*raytraverse.mapper.PlanMapper*) – the source mapper to copy
- **valid** (*np.array*) – a list of valid points used to make a mask, grid cells not represented by one of valid will be masked
- **level** (*int, optional*) – the level at which to grid the valid candidates

**update\_mask** (*valid, level*)

**in\_view\_uv** (*uv, indices=True, usemask=True*)

## 4.5 raytraverse.formatter

### 4.5.1 Formatter

```
class raytraverse.formatter.Formatter
    Bases: object

    scene formatter readies scene files for simulation, must be compatible with desired renderer.

    comment = '#'
        line comment character

    scene_ext = ''
        extension for renderer scene file

    static make_scene (scene_files, out, frozen=True)
        compile scene

    static add_source (scene, src)
        add source files to compiled scene

    static get_skydef (color=None, ground=True, name='skyglow')
        assemble sky definition

    static get_sundef (vec, color, size=0.5333, mat_name='solar', mat_id='sun', glow=False)
        assemble sun definition

    static extract_sources (srcdef, accuracy)
        scan scene file for sun source definitions
```

### 4.5.2 RadianceFormatter

```
class raytraverse.formatter.RadianceFormatter
    Bases: raytraverse.formatter.formatter.Formatter

    scene formatter readies scene files for simulation, must be compatible with desired renderer.

    comment = '#'
        line comment character

    scene_ext = '.oct'
        extension for renderer scene file

    static make_scene (scene_files, out, frozen=True)
        compile scene

    static add_source (scene, src, rewrite=False)
        add source files to compiled scene

    static get_skydef (color=0.96, 1.004, 1.118, ground=True, name='skyglow', mod='void',
                       groundname=None, groundcolor=1, 1, 1)
        assemble sky definition

    static get_sundef (vec, color, size=0.5333, mat_name='solar', mat_id='sun')
        assemble sun definition

    static extract_sources (srcdef, accuracy)
        scan scene file for sun source definitions
```

## 4.6 raytraverse.renderer

### 4.6.1 Renderer

**class** raytraverse.renderer.Renderer

Bases: object

virtual singleton renderer class. the Renderer is implemented as a singleton as specific subclasses (rtrace, rcontrib) have many global variables set at import time. This ensures the python object is connected to the current state of the engine c++-class.

All renderer classes are callable with with a numpy array of shape (N,6) representing the origin and direction of ray samples to calculate.

**args** = None

**instance** = <raytraverse.renderer.renderer.\_VirtEngine object>

**scene** = None

**classmethod** set\_args (args, nproc=None)

**run** (\*args, \*\*kwargs)

alias for call, for consistency with SamplerPt classes for nested dimensions of evaluation

### 4.6.2 RadianceRenderer

**class** raytraverse.renderer.RadianceRenderer (rayargs=None, scene=None, nproc=None, default\_args=True)

Bases: raytraverse.renderer.renderer.Renderer

Virtual class for wrapping c++ Radiance renderer executable classes

Do not use directly, either subclass or use existing: Rtrace, Rcontrib

**name** = 'radiance\_virtual'

**engine** = <cRtrace>

raytraverse.crenderer.cRtrace

**srcn** = 1

**defaultargs** = ''

**args** = None

**nproc** = None

**classmethod** get\_default\_args ()

**classmethod** reset ()

reset engine instance and unset associated attributees

**classmethod** set\_args (args, nproc=None)

prepare arguments to call engine instance initialization

**Parameters**

- **args** (str) – rendering options
- **nproc** (int, optional) – cpu limit

**classmethod** load\_scene (scene)

load octree file to engine instance

**Parameters** **scene** (str) – path to octree file

**Raises ValueError:** – can only be called after set\_args, otherwise engine instance will abort.

### 4.6.3 Rtrace

**class** raytraverse.renderer.**Rtrace** (*rayargs=None, scene=None, nproc=None, default\_args=True, direct=False*)

Bases: raytraverse.renderer.radiancerenderer.RadianceRenderer

singleton wrapper for c++ raytraverse.crenderer.cRtrace class

this class sets default arguments, helps with initialization and setting cpu limits of the cRtrace instance. see raytraverse.crenderer.cRtrace for more details.

#### Parameters

- **rayargs** (*str, optional*) – argument string (options and flags only) raises ValueError if arguments are not recognized by cRtrace.
- **scene** (*str, optional*) – path to octree
- **nproc** (*int, optional*) – if None, sets nproc to cpu count, or the RAYTRAVERSE\_PROC\_CAP environment variable
- **default\_args** (*bool, optional*) – if True, prepend default args to rayargs parameter
- **direct** (*bool, optional*) – if True use Rtrace.directargs in place of default (also if True, sets default\_args to True).

#### Examples

Basic Initialization and call:

```
r = renderer.Rtrace(args, scene)
ans = r(vecs)
# ans.shape -> (vecs.shape[0], 1)
```

If rayargs include cache files (ambient cache or photon map) be careful with updating sources. If you are going to swap sources, update the arguments as well with the new paths:

```
r = renderer.Rtrace(args, scene)
r.set_args(args.replace("temp.amb", "temp2.amb"))
r.load_source(srcdef)
```

Note that if you are using ambient caching, you must give an ambient file, because without a file ambient values are not shared across processes or successive calls to the instance.

**name** = 'rtrace'

**engine** = <cRtrace>  
raytraverse.crenderer.cRtrace

**defaultargs** = '-u+ -ab 16 -av 0 0 0 -aa 0 -as 0 -dc 1 -dt 0 -lr -14 -ad 1000 -lw 0.0'

**directargs** = '-w- -av 0 0 0 -ab 0 -lr 1 -n 1'

**usedirect** = False

**ospec** = 'Z'

**ocnt** = 1

**classmethod** **get\_default\_args**()  
return default arguments of the class

**classmethod** **set\_args**(*args, nproc=None*)  
prepare arguments to call engine instance initialization

#### Parameters

- **args** (*str*) – rendering options
- **nproc** (*int*, *optional*) – cpu limit

**classmethod** **update\_ospec** (*vs*)

set output of cRtrace instance

**Parameters** **vs** (*str*) –

**output specifiers for rtrace::** o origin (input) d direction (normalized) v value (radiance) V contribution (radiance) w weight W color coefficient l effective length of ray L first intersection distance c local (u,v) coordinates p point of intersection n normal at intersection (perturbed) N normal at intersection (unperturbed) r mirrored value contribution x unmirrored value contribution R mirrored ray length X unmirrored ray length

**Returns** **outcnt** – the number of output columns to expect when calling rtrace instance

**Return type** **int**

**Raises** **ValueError**: – when an output specifier is not recognized

**classmethod** **load\_source** (*srcfile*, *freesrc*=-1, *ambfile*=None)

add a source description to the loaded scene

**Parameters**

- **srcfile** (*str*) – path to radiance scene file containing sources, these should not change the bounding box of the octree and has only been tested with the “source” type.
- **freesrc** (*int*, *optional*) – the number of objects to unload from the end of the rtrace object list, if -1 unloads all objects loaded by previous calls to load\_source
- **ambfile** (*str*, *optional*) – path to ambient file. if given, and arguments

#### 4.6.4 Rcontrib

**class** raytraverse.renderer.**Rcontrib** (*rayargs*=None, *scene*=None, *nproc*=None, *skyres*=10.0, *modname*='skyglow', *ground*=True, *default\_args*=True)

Bases: raytraverse.renderer.radiancerenderer.RadianceRenderer

singleton wrapper for c++ raytraverse.crenderer.cRcontrib class

this class sets default arguments, helps with initialization and setting cpu limits of the cRcontrib instance. see raytraverse.crenderer.cRcontrib for more details.

**Parameters**

- **rayargs** (*str*, *optional*) – argument string (options and flags only) raises ValueError if arguments are not recognized by cRtrace.
- **scene** (*str*, *optional*) – path to octree
- **nproc** (*int*, *optional*) – if None, sets nproc to cpu count, or the RAYTRAVERSE\_PROC\_CAP environment variable
- **skyres** (*float*, *optional*) – approximate resolution for skypatch subdivision (in degrees). Patches will have (rounded) size skyres x skyres. So if skyres=10, each patch will be 100 sq. degrees (0.03046174197 steradians) and there will be 18 \* 18 = 324 sky patches.
- **modname** (*str*, *optional*) – passed the -m option of cRcontrib initialization
- **ground** (*bool*, *optional*) – if True include a ground source (included as a final bin)

- **default\_args** (*bool, optional*) – if True, prepend default args to rayargs parameter

## Examples

Basic Initialization and call:

```
r = renderer.Rcontrib(args, scene)
ans = r(vecs)
# ans.shape -> (vecs.shape[0], 325)
```

```
name = 'rcontrib'
```

```
engine = <cRcontrib>
        raytraverse.crenderer.cRcontrib
```

```
ground = True
```

```
side = 18
```

```
srcn = 325
```

```
modname = 'skyglow'
```

```
classmethod setup(scene=None, ground=True, modname='skyglow', skyres=10.0)
    set class attributes for proper argument initialization
```

### Parameters

- **scene** (*str, optional*) – path to octree
- **ground** (*bool, optional*) – if True include a ground source (included as a final bin)
- **modname** (*str, optional*) – passed the -m option of cRcontrib initialization
- **skyres** (*float, optional*) – approximate resolution for skypatch subdivision (in degrees). Patches will have (rounded) size skyres x skyres. So if skyres=10, each patch will be 100 sq. degrees (0.03046174197 steradians) and there will be 18 \* 18 = 324 sky patches.

**Returns** scene – path to scene with added sky definition

**Return type** str

```
classmethod get_default_args()
    construct default arguments
```

```
classmethod set_args(args, nproc=None)
    prepare arguments to call engine instance initialization
```

### Parameters

- **args** (*str*) – rendering options
- **nproc** (*int, optional*) – cpu limit

## 4.6.5 ImageRenderer

**class** raytraverse.renderer.ImageRenderer (*scene*, *viewmapper=None*, *method='linear'*)

Bases: raytraverse.renderer.renderer.Renderer

interface to treat image data as the source for ray tracing results

not implemented as a singleton, so multiple instances can exist in parallel.

### Parameters

- **scene** (*str*) – path to hdr image file with projecting matching ViewMapper
- **viewmapper** (*raytraverse.mapper.ViewMapper*, *optional*) – if None, assumes 180 degree angular fisheye (vta)
- **method** (*str*, *optional*) – passed to `scipy.interpolate.RegularGridInterpolator`

## 4.7 raytraverse.sky

### 4.7.1 skycalc

functions for loading sky data and computing sun position

`raytraverse.sky.skycalc.read_epw` (*epw*)

read daylight sky data from epw or wea file

**Returns out** – (month, day, hour, dirnorn, difhoriz)

**Return type** `np.array`

`raytraverse.sky.skycalc.read_epw_full` (*epw*, *columns=None*)

### Parameters

- **epw** –
- **columns** (*list*, *optional*) – integer indices or keys of columns to return

### Returns

**Return type** requested columns from epw as `np.array` shape (8760, N)

`raytraverse.sky.skycalc.get_loc_epw` (*epw*, *name=False*)

get location from epw or wea header

`raytraverse.sky.skycalc.sunpos_utc` (*timesteps*, *lat*, *lon*, *builtin=True*)

Calculate sun position with local time

Calculate sun position (altitude, azimuth) for a particular location (longitude, latitude) for a specific date and time (time is in UTC)

### Parameters

- **timesteps** (*np.array(datetime.datetime)*) –
- **lon** (*float*) – longitude in decimals. West is +ve
- **lat** (*float*) – latitude in decimals. North is +ve
- **builtin** (*bool*) – use skyfield builtin timescale

### Returns

- (*skyfield.units.Angle*, *skyfield.units.Angle*)
- *altitude and azimuth in degrees*

`raytraverse.sky.skycalc.row_2_datetime64` (*ts*, *year=2020*)

`raytraverse.sky.skycalc.datetime64_2_datetime` (*timesteps*, *mer*=0.0)  
convert datetime representation and offset for timezone

**Parameters**

- **timesteps** (*np.array(np.datetime64)*) –
- **mer** (*float*) – Meridian of the time zone. West is +ve

**Returns**

**Return type** `np.array(datetime.datetime)`

`raytraverse.sky.skycalc.sunpos_degrees` (*timesteps*, *lat*, *lon*, *mer*, *builtin*=True, *ro*=0.0)  
Calculate sun position with local time

Calculate sun position (altitude, azimuth) for a particular location (longitude, latitude) for a specific date and time (time is in local time)

**Parameters**

- **timesteps** (*np.array(np.datetime64)*) –
- **lon** (*float*) – longitude in decimals. West is +ve
- **lat** (*float*) – latitude in decimals. North is +ve
- **mer** (*float*) – Meridian of the time zone. West is +ve
- **builtin** (*bool*, *optional*) – use skyfield builtin timescale
- **ro** (*float*, *optional*) – ccw rotation (project to true north) in degrees

**Returns** Sun position as (altitude, azimuth) in degrees

**Return type** `np.array([float, float])`

`raytraverse.sky.skycalc.sunpos_radians` (*timesteps*, *lat*, *lon*, *mer*, *builtin*=True, *ro*=0.0)  
Calculate sun position with local time

Calculate sun position (altitude, azimuth) for a particular location (longitude, latitude) for a specific date and time (time is in local time)

**Parameters**

- **timesteps** (*np.array(np.datetime64)*) –
- **lon** (*float*) – longitude in decimals. West is +ve
- **lat** (*float*) – latitude in decimals. North is +ve
- **mer** (*float*) – Meridian of the time zone. West is +ve
- **builtin** (*bool*) – use skyfield builtin timescale
- **ro** (*float*, *optional*) – ccw rotation (project to true north) in radians

**Returns** Sun position as (altitude, azimuth) in radians

**Return type** `np.array([float, float])`

`raytraverse.sky.skycalc.sunpos_xyz` (*timesteps*, *lat*, *lon*, *mer*, *builtin*=True, *ro*=0.0)  
Calculate sun position with local time

Calculate sun position (altitude, azimuth) for a particular location (longitude, latitude) for a specific date and time (time is in local time)

**Parameters**

- **timesteps** (*np.array(np.datetime64)*) –
- **lon** (*float*) – longitude in decimals. West is +ve
- **lat** (*float*) – latitude in decimals. North is +ve

- **mer** (*float*) – Meridian of the time zone. West is +ve
- **builtin** (*bool*) – use skyfield builtin timescale
- **ro** (*float, optional*) – ccw rotation (project to true north) in degrees

**Returns** Sun position as (x, y, z)

**Return type** np.array

```
raytraverse.sky.skycalc.generate_wea (ts, wea, interp='linear')
raytraverse.sky.skycalc.coeff_lum_perez (sunz, epsilon, delta, catn)
    matches coeff_lum_perez in gendaylit.c
raytraverse.sky.skycalc.perez_apply_coef (coefs, cgamma, dz)
raytraverse.sky.skycalc.perez_lum_raw (tp, dz, sunz, coefs)
    matches calc_rel_lum_perez in gendaylit.c
raytraverse.sky.skycalc.perez_lum (xyz, coefs, intersky=True)
    matches perezlum.cal
raytraverse.sky.skycalc.scale_efficacy (dirdif, sunz, csunz, skybright, catn,
    td=10.9735311509)
raytraverse.sky.skycalc.perez (sxyz, dirdif, md=None, ground_fac=0.2, td=10.9735311509)
    compute perez coefficients
```

## Notes

to match the results of gendaylit, for a given sun angle without associated date, the assumed eccentricity is 1.035020

### Parameters

- **sxyz** (*np.array*) – (N, 3) dx, dy, dz sun position
- **dirdif** (*np.array*) – (N, 2) direct normal, diffuse horizontal W/m<sup>2</sup>
- **md** (*np.array, optional*) – (N, 2) month day of sky calcs (for more precise eccentricity calc)
- **ground\_fac** (*float*) – scaling factor (reflectance) for ground brightness
- **td** (*np.array float, optional*) – (N,) dew point temperature in C

**Returns** **perez** – (N, 10) diffuse normalization, ground brightness, perez coefs, x, y, z

**Return type** np.array

```
raytraverse.sky.skycalc.sky_mtx (sxyz, dirdif, side, jn=4, intersky=True, **kwargs)
    generate sky, ground and sun values from sun position and sky values
```

### Parameters

- **sxyz** (*np.array*) – sun directions (N, 3)
- **dirdif** (*np.array*) – direct normal and diffuse horizontal radiation (W/m<sup>2</sup>) (N, 2)
- **side** (*int*) – sky subdivision
- **jn** (*int, optional*) – sky patch subdivision  $n = jn^2$
- **intersky** (*bool, optional*) – include interreflection between ground and sky (mimics perezlum.cal, not present in gendaymtx)
- **kwargs** (*dict, optional*) – passed to perez()

### Returns

- **skymtx** (*np.array*) – (N, side\*side)

- **grndval** (*np.array*) – (N,)
- **sunval** (*np.array*) – (N, 4) - sun direction and radiance

`raytraverse.sky.skycalc.radiance_skydef` (*sunpos*, *dirdif*, *loc=None*, *md=None*,  
*ground\_fac=0.2*, *td=10.9735311509*, *ro=0.0*)

similar to gendaylit, returns strings

#### Parameters

- **sunpos** (*Sequence*) – dx, dy, dz sun position or m,d,h (if loc is not None)
- **dirdif** (*Sequence*) – direct normal, diffuse horizontal W/m<sup>2</sup>
- **loc** (*tuple*, *optional*) – location data given as lat, lon, mer with + west of prime meridian triggers sunpos treated as timestep
- **md** (*tuple*, *optional*) – month day of sky calcs (for more precise eccentricity calc with xyz sunpos)
- **ground\_fac** (*float*) – scaling factor (reflectance) for ground brightness
- **td** (*np.array float*, *optional*) – (N,) dew point temperature in C
- **ro** (*float*, *optional*) – ignored if sunpos is xyz, else angle in degrees counter-clockwise to rotate sky (to correct model north, equivalent to clockwise rotation of scene)

#### Returns

- **desc** (*str*) – comments with sky info
- **sund** (*str*) – solar material and sun object ("" if no sun)
- **skyd** (*str*) – perezlum brightfunc definition and sky/ground objects

## 4.7.2 SkyData

**class** `raytraverse.sky.SkyData` (*wea*, *loc=None*, *skyro=0.0*, *ground\_fac=0.2*, *intersky=True*,  
*skyres=12.0*, *minalt=2.0*, *mindiff=5.0*, *mindir=0.0*)

Bases: `object`

class to generate sky conditions

This class provides an interface to generate sky data using the perez sky model

#### Parameters

- **wea** (*str np.array*) – path to epw, wea, .npy file or np.array, or .npz file, if loc not set attempts to extract location data (if needed).
- **loc** (*tuple*, *optional*) – location data given as lat, lon, mer with + west of prime meridian overrides location data in wea (but not in sunfield)
- **skyro** (*float*, *optional*) – angle in degrees counter-clockwise to rotate sky (to correct model north, equivalent to clockwise rotation of scene)
- **ground\_fac** (*float*, *optional*) – ground reflectance
- **intersky** (*bool*, *optional*) – include interreflection between ground and sky (mimics perezlum.cal, not present in gendaymtx)
- **skyres** (*float*, *optional*) – approximate square patch size in degrees
- **minalt** (*float*, *optional*) – minimum solar altitude for daylight masking
- **mindiff** (*float*, *optional*) – minumum diffuse horizontal irradiance for daylight masking

property `side`

**property skyres**

**property skyro**

sky rotation (in degrees, ccw)

**property loc**

lot, lon, mer (in degrees, west is positive)

**property rowlabel**

m,d,h (if known)

**property skydata**

sun position and dirnorm diffhoriz

**write** (*name='skydata', scene=None, compressed=True*)

**format\_skydata** (*dat*)

process dat argument as skydata

see sky.setter for details on argument

**Returns** dx, dy, dz, dir, diff

**Return type** np.array

**property daysteps**

**property daymask**

shape (len(skydata),) boolean array masking timesteps when sun is below horizon

**property fullmask**

**property maskindices**

**property mask**

an additional mask for smtx data

**property smtx**

shape (np.sum(daymask), side\*\*2 + 1) coefficients for each sky patch each row is a timestep, coefficients exclude sun

**property sun**

shape (np.sum(daymask), 5) sun position (index 0,1,2) and coefficients for sun at each timestep assuming the true solid angle of the sun (index 3) and the weighted value for the sky patch (index 4).

**property sunproxy**

corresponding sky bin for each sun position in daymask

**smtx\_patch\_sun** (*includesky=True*)

generate smtx with solar energy applied to proxy patch for directly applying to skysampler data (without direct sun components) can also be used in a partial mode (with sun view / without sun reflection.)

**header** ()

generate image header string

**fill\_data** (*x, fill\_value=0.0, rowlabels=False*)

**Parameters**

- **x** (*np.array*) – first axis size = len(self.daymask[self.mask])
- **fill\_value** (*Union[int, float], optional*) – value in padded array
- **rowlabels** (*bool, optional*) – include rowlabels

**Returns** data in x padded with fill value to original shape of skydata

**Return type** np.array

**label** (*x*)

**masked\_idx** (*i*)

**radiance\_sky\_matrix** (*outf, fmt='float', sun=True, sky=True, ncomps=3*)

**sky\_description** (*i, prefix='skydata', grid=False, sun=True, ground=True, sunpatch=False*)  
generate radiance scene files to directly render sky data at index *i*

**Parameters**

- **i** (*int*) – index of sky vector to generate (indexed from skydata, not daymask)
- **prefix** (*str, optional*) – name/path for output files
- **grid** (*bool, optional*) – render sky patches with grid lines
- **sun** (*bool, optional*) – include sun source in rad file

**Returns** basename of 3 files written: *prefix\_i* (.rad, .cal, and .dat) .cal and .dat must be located in RAYPATH (which can include .) or else edit the .rad file to explicitly point to their locations. note that if grid is True, the sky will not be accurate, so only use this for illustrative purposes.

**Return type** *str*

**Raises** **IndexError** – if *i* is not in masked indices

## 4.8 raytraverse.sampler

### 4.8.1 draw

wavelet and associated probability functions.

**raytraverse.sampler.draw.get\_detail** (*data, \*args, mode='reflect', cval=0.0*)  
convolve a set of kernels with data. computes the sum of the absolute values of each convolution.

**Parameters**

- **data** (*np.array*) – source data (atleast 2D), detail calculated over last 2D
- **args** (*np.array*) – filters
- **mode** (*str*) – signal extension mode (passed to *scipy.ndimage.convolve*)
- **cval** (*float*) – constant value (passed to *scipy.ndimage.convolve*, used when *mode='constant'*)

**Returns** **detail\_array** – 1d array of detail coefficients (row major order) matching size of data

**Return type** *np.array*

**raytraverse.sampler.draw.from\_pdf** (*pdf, threshold, lb=0.5, ub=4*)  
generate choices from a numeric probability distribution

**Parameters**

- **pdf** (*np.array*) – 1-d array of weights
- **threshold** (*float*) – the threshold used to determine the number of choices to draw given by *pdf > threshold*
- **lb** (*float, optional*) – values below *threshold \* lb* will be excluded from candidates (*lb* must be in (0,1))
- **ub** (*float, optional*) – the maximum weight is set to *ub\*threshold*, meaning all values in *pdf >= ub\*threshold* have an equal chance of being selected. in cases where extreme values are much higher than moderate values, but 100% sampling of extreme areas should be avoided, this value should be lower, such as when a region is sampled at a very high resolution ( as is the case with directional sampling). On the other hand, set this value higher for sampling schemes with a low final resolution (like area sampling).

If  $ub \leq 1$ , then a deterministic choice is made, returning the idx of all values in pdf > threshold.

**Returns** `idx` – an index array of choices, size varies.

**Return type** `np.array`

## 4.8.2 BaseSampler

**class** `raytraverse.sampler.BaseSampler` (*scene, engine, accuracy=1.0, stype='generic', samplerlevel=0*)

Bases: `object`

wavelet based sampling class this is a virtual class that holds the shared sampling methods across directional, area, and sunposition samplers. subclasses are named as: {Source}Sampler{SamplingRange}, for instance:

- **SamplerPt: virtual base class for sampling directions from a point**
  - SkySamplerPt: sampling directions from a point with a sky patch source.
  - SunSamplerPt: sampling directions from a point with a single sun source
  - SunSamplerPtView: sampling the view from a point of the sun
  - ImageSampler: (re)sampling a fisheye image, useful for testing
- **SamplerArea:** sampling points on a horizontal planar area with any source type
- **SamplerSuns:** sampling sun positions (with nested area sampler)

### Parameters

- **scene** (`raytraverse.scene.Scene`) – scene class containing geometry and formatter compatible with engine
- **engine** – has a `run()` method
- **accuracy** (*float, optional*) – parameter to set threshold at sampling level relative to final level threshold (smaller number will increase sampling, default is 1.0)
- **stype** (*str, optional*) – sampler type (prefixes output files)

**t0** = 0.00390625

initial sampling threshold coefficient this value times the accuracy parameter is passed to `raytraverse.sampler.draw.from_pdf()` at level 0 (usually not used)

**t1** = 0.0625

final sampling threshold coefficient this value times the accuracy parameter is passed to `raytraverse.sampler.draw.from_pdf()` at final level, intermediate sampling levels are thresholded by a linearly interpolated between t0 and t1

**lb** = 0.25

lower bound for drawing from pdf passed to `raytraverse.sampler.draw.from_pdf()`

**ub** = 8

upper bound for drawing from pdf passed to `raytraverse.sampler.draw.from_pdf()`

**scene** = None

scene information

**Type** `raytraverse.scene.Scene`

**accuracy** = None

accuracy parameter some subclassed samplers may apply a scale factor to normalize threshold values depending on source brightness (see for instance `ImageSampler` and `SunSamplerPt`)

**Type** `float`

**stype** = None  
sampler type

**Type** str

**weights** = None  
holds weights for self.draw

**Type** np.array

**property levels**  
sampling scheme

**Getter** Returns the sampling scheme

**Setter** Set the sampling scheme

**Type** np.array

**sampling\_scheme** (\*args)  
calculate sampling scheme

**run** (mapper, name, levels, plotp=False, log='err', pfish=True, \*\*kwargs)  
trigger a sampling run. subclasses should return a LightPoint/LightField from the executed object state (first call this method with super().run(...))

#### Parameters

- **mapper** (raytraverse.mapper.Mapper) – mapper to sample
- **name** (str) – output name
- **levels** (np.array) – the sampling scheme
- **plotp** (bool, optional) – plot weights, detail and vectors for each level
- **log** (str, optional) – whether to log level sampling rates can be 'scene', 'err' or None 'scene' - logs to Scene log file 'err' - logs to stderr anything else - does not log incremental progress
- **pfish** (bool, optional) – if True and plotp, use fisheye projection for detail/weight/vector images.
- **kwargs** – unused

**draw** (level)  
draw samples based on detail calculated from weights

#### Returns

- **pdraws** (np.array) – index array of flattened samples chosen to sample at next level
- **p** (np.array) – computed probabilities

**sample\_to\_uv** (pdraws, shape)  
generate samples vectors from flat draw indices

#### Parameters

- **pdraws** (np.array) – flat index positions of samples to generate
- **shape** (tuple) – shape of level samples

#### Returns

- **si** (np.array) – index array of draws matching samp.shape
- **vecs** (np.array) – sample vectors

**sample** (vecs)  
call rendering engine to sample rays

**Parameters** **vecs** (np.array) – sample vectors (subclasses can choose which to use)

**Returns** `lum` – array of shape (N,) to update weights

**Return type** `np.array`

**detailfunc** = 'wav'

filter banks for calculating detail choices:

'haar':  $[[1 \ -1]]/2, [[1] \ [-1]]/2, [[1, 0] \ [0, -1]]/2$

'wav':  $[[ -1 \ 2 \ -1]] / 2, [[ -1] \ [2] \ [-1]] / 2, [[ -1 \ 0 \ 0] \ [0 \ 2 \ 0] \ [0 \ 0 \ -1]] / 2$

### 4.8.3 SamplerSuns

**class** `raytraverse.sampler.SamplerSuns` (*scene, engine, accuracy=1.0, nlev=3, jitter=True, ptkwargs=None, areakwargs=None, metricset='avglum', 'loggcr'*)

Bases: `raytraverse.sampler.basesampler.BaseSampler`

wavelet based sun position sampling class

#### Parameters

- **scene** (`raytraverse.scene.Scene`) – scene class containing geometry and formatter compatible with engine
- **engine** (`raytraverse.renderer.Rtrace`) – initialized renderer instance (with scene loaded, no sources)
- **accuracy** (*float, optional*) – parameter to set threshold at sampling level relative to final level threshold (smaller number will increase sampling, default is 1.0)
- **nlev** (*int, optional*) – number of levels to sample
- **jitter** (*bool, optional*) – jitter samples
- **ptkwargs** (*dict, optional*) – kwargs for `raytraverse.sampler.SunSamplerPt` initialization
- **areakwargs** (*dict, optional*) – kwargs for `raytraverse.sampler.SamplerArea` initialization
- **metricset** (*iterable, optional*) – subset of `samplerarea.metric` set to use for sun detail calculation.

**t0** = 0.05

initial sampling threshold coefficient

**t1** = 0.125

final sampling threshold coefficient

**ub** = 8

upper bound for drawing from pdf

**sampling\_scheme** (*mapper*)

calculate sampling scheme

**get\_existing\_run** (*skymapper, areamapper*)

check for file conflicts before running/overwriting parameters match call to run

#### Parameters

- **skymapper** (`raytraverse.mapper.SkyMapper`) – the mapping for drawing suns
- **areamapper** (`raytraverse.mapper.PlanMapper`) – the mapping for drawing points

**Returns****conflicts** –

a tuple of found conflicts (None for each if no conflicts:

- **suns**: np.array of sun positions in vfile
- **ptfiles**: existing point files

**Return type** tuple

**run** (*skymapper*, *areamapper*, *specguide=None*, *recover=True*, *\*\*kwargs*)  
adaptively sample sun positions for an area (also adaptively sampled)

**Parameters**

- **skymapper** (*raytraverse.mapper.SkyMapper*) – the mapping for drawing suns
- **areamapper** (*raytraverse.mapper.PlanMapper*) – the mapping for drawing points
- **specguide** (*raytraverse.lightfield.LightPlaneKD*) – sky source lightfield to use as specular guide for sampling
- **recover** (*continue run on top of existing files, if false, overwrites*) – previous run.
- **kwargs** – passed to self.run()

**Returns**

**Return type** raytraverse.lightplane.LightPlaneKD

**draw** (*level*)

draw on condition of in\_solarbounds from skymapper. In this way all solar positions are presented to the area sampler, but the area sampler is initialized with a weighting to sample only where there is variance between sun position. this keeps the subsampling of area and solar position independent.

**Returns**

- **pdraws** (*np.array*) – index array of flattened samples chosen to sample at next level
- **p** (*np.array*) – computed probabilities

**sample\_to\_uv** (*pdraws*, *shape*)  
generate samples vectors from flat draw indices

**Parameters**

- **pdraws** (*np.array*) – flat index positions of samples to generate
- **shape** (*tuple*) – shape of level samples

**Returns**

- **si** (*np.array*) – index array of draws matching samp.shape
- **vecs** (*np.array*) – sample vectors

**sample** (*vecs*)  
call rendering engine to sample rays

**Parameters** **vecs** (*np.array*) – sample vectors

**Returns** **lum** – array of shape (N,) to update weights

**Return type** np.array

#### 4.8.4 SamplerArea

```
class raytraverse.sampler.SamplerArea(scene, engine, accuracy=1.0, nlev=3,
                                     jitter=True, edgemode='constant',
                                     metricclass=<class 'raytraverse.evaluate.samplingmetrics.SamplingMetrics'>,
                                     metricset=('avglum', 'loggcr', 'xpeak', 'ypeak'),
                                     metricfunc=<function amax>, **kwargs)
```

Bases: raytraverse.sampler.basesampler.BaseSampler

wavelet based area sampling class

##### Parameters

- **scene** (raytraverse.scene.Scene) – scene class containing geometry and former compatible with engine
- **engine** (raytraverse.sampler.SamplerPt) – point sampler
- **accuracy** (float, optional) – parameter to set threshold at sampling level relative to final level threshold (smaller number will increase sampling, default is 1.0)
- **nlev** (int, optional) – number of levels to sample
- **jitter** (bool, optional) – jitter samples
- **edgemode** ({'reflect', 'constant', 'nearest', 'mirror', 'wrap'}, optional) – default: 'constant', if 'constant' value is set to -self.t1, so edge is always seen as detail. Internal edges (resulting from PlanMapper borders) will behave like 'nearest' for all options except 'constant'
- **metricclass** (raytraverse.evaluate.BaseMetricSet, optional) – the metric calculator used to compute weights
- **metricset** (iterable, optional) – list of metrics (must be recognized by metricclass. metrics containing “lum” will be normalized to 0-1)
- **metricfunc** (func, optional) – takes detail array as an argument, shape: (len(metricset),N, M) and an axis=0 keyword argument, returns shape (N, M). could be np.max, np.sum np.average or us custom function following the same pattern.

**t0** = 0.1  
initial sampling threshold coefficient

**t1** = 0.9  
final sampling threshold coefficient

**ub** = 100  
upper bound for drawing from pdf

**metricclass** = None  
raytraverse.evaluate.BaseMetricSet

**metricset** = None  
iterable

**features** = None  
int:

**sampling\_scheme** (mapper)  
calculate sampling scheme

**run** (mapper, name=None, specguide=None, plotp=False, find\_reflections=False, \*\*kwargs)  
adapively sample an area defined by mapper

##### Parameters

- **mapper** (raytraverse.mapper.PlanMapper) – the pointset to build/run

- **name** (*str*, *optional*) –
- **specguide** (`raytraverse.lightfield.LightPlaneKD`) – sky source lightfield to use as specular guide for sampling (used by engine of type `raytraverse.sampler.SunSamplerPt`)
- **plotp** (*bool*, *optional*) – plot weights, detail and vectors for each level
- **find\_reflections** (*bool*, *optional*) – write file for zone with potential reflection normals
- **kwargs** – passed to `self.run()`

**Returns**

**Return type** `raytraverse.lightplane.LightPlaneKD`

**reflection\_search** (*vecs*, *res=5*)

**repeat** (*guide*, *stype*)

repeat the sampling of a guide `LightPlane` (to match all rays)

**Parameters**

- **guide** (`LightPlaneKD`) –
- **stype** (*str*, *optional*) – alternate stype name for `samplerpt`. raises a `ValueError` if it matches the guide.

**draw** (*level*)

draw samples based on detail calculated from weights

**Returns**

- **pdraws** (*np.array*) – index array of flattened samples chosen to sample at next level
- **p** (*np.array*) – computed probabilities

**sample\_to\_uv** (*pdraws*, *shape*)

generate samples vectors from flat draw indices

**Parameters**

- **pdraws** (*np.array*) – flat index positions of samples to generate
- **shape** (*tuple*) – shape of level samples

**Returns**

- **si** (*np.array*) – index array of draws matching `samps.shape`
- **vecs** (*np.array*) – sample vectors

**sample** (*vecs*)

call rendering engine to sample rays

**Parameters** **vecs** (*np.array*) – sample vectors (subclasses can choose which to use)

**Returns** **lum** – array of shape (N,) to update weights

**Return type** `np.array`

### 4.8.5 SamplerPt

```
class raytraverse.sampler.SamplerPt(scene, engine, idres=5, fdres=9, accuracy=1.0,
                                   srcn=1, stype='generic', bands=1, samplerlevel=0,
                                   **kwargs)
```

Bases: raytraverse.sampler.basesampler.BaseSampler

wavelet based sampling class for direction rays from a point

#### Parameters

- **scene** (raytraverse.scene.Scene) – scene class containing geometry and format compatible with engine
- **engine** (raytraverse.renderer.Renderer) – should inherit from raytraverse.renderer.Renderer
- **idres** (int, optional) – initial direction resolution (as log2(res))
- **fdres** (int, optional) – final directional resolution given as log2(res)
- **accuracy** (float, optional) – parameter to set threshold at sampling level relative to final level threshold (smaller number will increase sampling, default is 1.0)
- **srcn** (int, optional) – number of sources return per vector by run
- **stype** (str, optional) – sampler type (prefixes output files)
- **srcdef** (str, optional) – path or string with source definition to add to scene
- **plotp** (bool, optional) – show probability distribution plots at each level (first point only)
- **bands** (int, optional) – number of spectral bands returned by the engine
- **engine\_args** (str, optional) – command line arguments used to initialize engine
- **nproc** (int, optional) – number of processors to give to the engine, if None, uses os.cpu\_count()

**bands = None**

number of spectral bands / channels returned by renderer based on given renderopts (user ensures these agree).

Type int

**srcn = None**

number of sources return per vector by run

Type int

**idres = None**

initial direction resolution (as log2(res))

Type int

**sampling\_scheme** (a)

calculate sampling scheme

**run** (point, posidx, mapper=None, lpargs=None, \*\*kwargs)

sample a single point, position index handles file naming

#### Parameters

- **point** (np.array) – point to sample
- **posidx** (int) – position index
- **mapper** (raytraverse.mapper.ViewMapper) – view direction to sample

- **lpargs** (*dict, optional*) – keyword arguments forwarded to LightPointKD construction
- **kwargs** – passed to BaseSampler.run()

**Returns****Return type** *LightPointKD***repeat** (*guide, stype*)

## 4.8.6 SkySamplerPt

**class** raytraverse.sampler.SkySamplerPt (*scene, engine, \*\*kwargs*)

Bases: raytraverse.sampler.samplerpt.SamplerPt

sample contributions from the sky hemisphere according to a square grid transformed by shirley-chiu mapping using rcontrib.

**Parameters**

- **scene** (*raytraverse.scene.Scene*) – scene class containing geometry, location and analysis plane scene: str, optional (required if not reload) space separated list of radiance scene files (no sky) or octree
- **engine** (*raytraverse.renderer.Rcontrib*) – initialized rendering instance

**sample** (*vecs*)

call rendering engine to sample rays

**Parameters** **vecs** (*np.array*) – sample vectors (subclasses can choose which to use)**Returns** **lum** – array of shape (N,) to update weights**Return type** np.array

## 4.8.7 SunSamplerPt

**class** raytraverse.sampler.SunSamplerPt (*scene, engine, sun, sunbin, speclevel=9, fdres=10, slimit=0.01, maxspec=0.2, stype='sun', \*\*kwargs*)

Bases: raytraverse.sampler.samplerpt.SamplerPt

sample contributions from direct suns.

**Parameters**

- **scene** (*raytraverse.scene.Scene*) – scene class containing geometry, location and analysis plane
- **engine** (*raytraverse.renderer.Rtrace*) – initialized renderer instance (with scene loaded, no sources)
- **sun** (*np.array*) – shape 3, sun position
- **sunbin** (*int*) – sun bin
- **speclevel** (*int, optional*) – at this sampling level, pdf is made from brightness of sky sampling rather than progressive variance to look for fine scale specular highlights, this should be atleast 1 level from the end and the resolution of this level should be smaller than the size of the source
- **slimit** (*float, optional*) – the minimum value in the specular guide considered as a potential specular reflection source, in the case of low vlt glazing, this value should be reduced.

- **maxspec** (*float, optional*) – the maximum value in the specular guide considered as a specular reflection source. above this value it is assumed that these are direct view rays to the source so are not sampled. in the case of low vlt glazing, this value should be reduced. In mixed (high-low) vlt scenes the specular guide will either over sample (including direct views) or under sample (miss specular reflections) depending on this setting.

**specidx** = None

index of level at which brightness sampling occurs

**Type** int

**sunpos** = None

sun position x,y,z

**Type** np.array

**run** (*point, posidx, vm=None, plotp=False, specguide=None, \*\*kwargs*)

sample a single point, position index handles file naming

#### Parameters

- **point** (*np.array*) – point to sample
- **posidx** (*int*) – position index
- **mapper** (*raytraverse.mapper.ViewMapper*) – view direction to sample
- **lpargs** (*dict, optional*) – keyword arguments forwarded to LightPointKD construction
- **kwargs** – passed to BaseSampler.run()

#### Returns

**Return type** *LightPointKD*

**draw** (*level*)

draw samples based on detail calculated from weights

**Returns** **pdraws** – index array of flattened samples chosen to sample at next level

**Return type** np.array

### 4.8.8 SunSamplerPtView

**class** raytraverse.sampler.SunSamplerPtView (*scene, engine, sun, sunbin, \*\*kwargs*)

Bases: raytraverse.sampler.samplerpt.SamplerPt

sample view rays to a source.

#### Parameters

- **scene** (*raytraverse.scene.Scene*) – scene class containing geometry, location and analysis plane
- **sun** (*np.array*) – the direction to the source
- **sunbin** (*int*) – index for naming

**ub** = 1

deterministic sample draws

**run** (*point, posidx, vm=None, plotp=False, log=None, \*\*kwargs*)

sample a single point, position index handles file naming

#### Parameters

- **point** (*np.array*) – point to sample

- **posidx** (*int*) – position index
- **mapper** (`raytraverse.mapper.ViewMapper`) – view direction to sample
- **lpargs** (*dict*, *optional*) – keyword arguments forwarded to LightPointKD construction
- **kwargs** – passed to BaseSampler.run()

**Returns**

**Return type** *LightPointKD*

### 4.8.9 ImageSampler

```
class raytraverse.sampler.ImageSampler (scene,          vm=None,          scalefac=None,
                                         method='linear', **kwargs)
Bases: raytraverse.sampler.samplerpt.SamplerPt
sample image (for testing algorithms).
```

**Parameters**

- **scene** (`raytraverse.scene.ImageScene`) – scene class containing image file information
- **scalefac** (*float*, *optional*) – by default set to the average of non-zero pixels in the image used to establish sampling thresholds similar to contribution based samplers

### 4.8.10 DeterministicImageSampler

```
class raytraverse.sampler.DeterministicImageSampler (scene, vm=None, scale-
                                                         fac=None, method='linear',
                                                         **kwargs)
Bases: raytraverse.sampler.imagesampler.ImageSampler
ub = 1
run (point, posidx, mapper=None, lpargs=None, **kwargs)
    sample a single point, position index handles file naming
```

**Parameters**

- **point** (*np.array*) – point to sample
- **posidx** (*int*) – position index
- **mapper** (`raytraverse.mapper.ViewMapper`) – view direction to sample
- **lpargs** (*dict*, *optional*) – keyword arguments forwarded to LightPointKD construction
- **kwargs** – passed to BaseSampler.run()

**Returns**

**Return type** *LightPointKD*

## 4.9 raytraverse.lightpoint

### 4.9.1 LightPointKD

```
class raytraverse.lightpoint.LightPointKD(scene, vec=None, lum=None, vm=None,
                                           pt=0, 0, 0, posidx=0, src='sky', srcn=1,
                                           srcdir=0, 0, 1, calcomega=True,
                                           write=True, omega=None, filter-
                                           views=True, srcviews=None, parent=None,
                                           srcviewidxs=None)
```

Bases: object

light distribution from a point with KDtree structure for directional query

#### Parameters

- **scene** (raytraverse.scene.BaseScene) –
- **vec** (np.array, optional) – shape (N, >=3) where last three columns are normalized direction vectors of samples. If not given, tries to load from scene.outdir
- **lum** (np.array, optional) – reshapeable to (N, srcn). sample values for each source corresponding to vec. If not given, tries to load from scene.outdir
- **vm** (raytraverse.mapper.ViewMapper, optional) – a default viewmapper for image and metric calculations, should match viewmapper of sampler.run() if possible.
- **pt** (tuple list np.array) – 3 item point location of light distribution
- **posidx** (int, optional) – index position of point, will govern file naming so must be set to avoid clobbering writes. also used by spacemapper for planar sampling
- **src** (str, optional) – name of source group. will govern file naming so must be set to avoid clobbering writes.
- **srcn** (int, optional) – must match lum, does not need to be set if reloading from scene.outdir
- **calcomega** (bool, optional) – if True (default) calculate solid angle of rays. This is unnecessary if point will be combined before calculating any metrics. setting to False will save some computation time.
- **write** (bool, optional) – whether to save ray data to disk.
- **omega** (np.array, optional) – provide precomputed omega values, if given, overrides calcomega

**vm** = None  
raytraverse.mapper.ViewMapper

**scene** = None  
raytraverse.scene.Scene

**posidx** = None  
index for point

Type int

**pt** = None  
point location

Type np.array

**src** = None  
source key

Type str

**file** = None  
relative path to disk storage  
**Type** str

**srcdir** = None  
direction to source(s)

**load()**

**dump()**

**property vec**  
direction vector (N,3)

**property lum**  
luminance (N,srcn)

**property d\_kd**  
kd tree for spatial query  
**Getter** Returns kd tree structure  
**Type** scipy.spatial.cKDTree

**property omega**  
solid angle (N)  
**Getter** Returns array of solid angles  
**Setter** sets soolid angles with viewmapper  
**Type** np.array

**set\_srcviews** (srcviews, idxs=None)

**calc\_omega** (write=True)  
calculate solid angle  
**Parameters** **write** (*bool, optional*) – update/write kdtree data to file

**apply\_coef** (coefs)  
apply coefficient vector to self.lum  
**Parameters** **coefs** (*np.array int float list*) – shape (N, self.srcn) or broadcastable  
**Returns** **alum** – shape (N, self.vec.shape[0])  
**Return type** np.array

**add\_to\_img** (img, vecs, mask=None, skyvec=1, interp=False, idx=None, interpweights=None, omega=False, vm=None, rnd=False, engine=None, \*\*kwargs)  
add luminance contributions to image array (updates in place)  
**Parameters**

- **img** (*np.array*) – 2D image array to add to (either zeros or with other source)
- **vecs** (*np.array*) – vectors corresponding to img pixels shape (N, 3)
- **mask** (*np.array, optional*) – indices to img that correspond to vec (in case where whole image is not being updated, such as corners of fisheye)
- **skyvec** (*int float np.array, optional*) – source coefficients, shape is (1,) or (srcn,)
- **interp** (*Union[bool, str], optional*) – if “precomp”, use index and interpweights if True and engine is None, linearinterpolation if “fast” and engine: uses content\_interp if “high” and engine: uses content\_interp\_wedge
- **idx** (*np.array, optional*) – precomputed query/interpolation result

- **interpweights** (*np.array, optional*) – precomputed interpolation weights
- **omega** (*bool*) – if true, add value of ray solid angle instead of luminance
- **vm** (*raytraverse.mapper.ViewMapper, optional*) –
- **rnd** (*bool, optional*) – use random values as contribution (for visualizing data shape)
- **engine** (*raytraverse.renderer.Rtrace, optional*) – engine for content aware interpolation
- **kwargs** (*dict, optional*) – passed to interpolationn functions

**evaluate** (*skyvec, vm=None, idx=None, srconly=False, blursun=False, includeviews=True*)

return rays within view with skyvec applied. this is the analog to add\_to\_img for metric calculations

#### Parameters

- **skyvec** (*int float np.array, optional*) – source coefficients, shape is (1,) or (srcn,)
- **vm** (*raytraverse.mapper.ViewMapper, optional*) –
- **idx** (*np.array, optional*) – precomputed query\_ball result
- **srconly** (*bool, optional*) – only evaluate direct sources (stored in self.srcviews)
- **includeviews** (*bool, optional*) – include src views in returned results

#### Returns

- **rays** (*np.array*) – shape (N, 3) rays falling within view
- **omega** (*np.array*) – shape (N,) associated solid angles
- **lum** (*np.array*) – shape (N,) associated luminances

**query\_ray** (*vecs*)

return the index and distance of the nearest ray to each of vecs

**Parameters** **vecs** (*np.array*) – shape (N, 3) normalized vectors to query, could represent image pixels for example.

#### Returns

- **i** (*np.array*) – integer indices of closest ray to each query
- **d** (*np.array*) – distance (corresponds to chord length on unit sphere) from query to ray in lightpoint. use `translate.chord2theta` to convert to angle.

**query\_ball** (*vecs, viewangle=180*)

return set of rays within a view cone

#### Parameters

- **vecs** (*np.array*) – shape (N, 3) vectors to query.
- **viewangle** (*int float*) – opening angle of view cone

**Returns** **i** – if vecs is a single point, a list of vector indices of rays within view cone. if vecs is a set of point an array of lists, one for each vec is returned.

**Return type** list np.array

**make\_image** (*outf, skyvec, vm=None, res=1024, interp=False, showsample=False*)

**direct\_view** (*res=512, showsample=False, showweight=True, rnd=False, srcidx=None, interp=False, omega=False, scalefactor=1, vm=None, fisheye=True*)  
create an unweighted summary image of lightpoint

**add** (*lf2*, *src=None*, *calcomega=True*, *write=False*, *sumsrc=False*)  
add light points of distinct sources together results in a new lightpoint with *srcn*=*self.srcn*+*srcn2* and  
vector size=*self.vecsize*+*vecsize2*

#### Parameters

- **lf2** (*raytraverse.lightpoint.LightPointKD*) –
- **src** (*str*, *optional*) – if None (default), *src* is “{*lf1.src*}\_ {*lf2.src*}”
- **calcomega** (*bool*, *optional*) – passed to *LightPointKD* constructor
- **write** (*bool*, *optional*) – passed to *LightPointKD* constructor
- **sumsrc** (*bool*, *optional*) – if True adds matching source indices together (must be same shape) this assumes that the two lightpoints represent the same source but different components (such as direct/indirect)

**Returns** will be subtyped according to *self*, unless *lf2* is needed to preserve data

**Return type** *raytraverse.lightpoint.LightPointKD*

**update** (*vec*, *lum*, *omega=None*, *calcomega=True*, *write=True*, *filterviews=False*)  
add additional rays to lightpoint in place

#### Parameters

- **vec** (*np.array*, *optional*) – shape (N, >=3) where last three columns are normalized direction vectors of samples.
- **lum** (*np.array*, *optional*) – reshapeable to (N, *srcn*). sample values for each source corresponding to *vec*.
- **omega** (*np.array*, *optional*) – provide precomputed omega values, if given, overrides *calcomega*
- **calcomega** (*bool*, *optional*) – if True (default) calculate solid angle of rays. This is unnecessary if point will be combined before calculating any metrics. setting to False will save some computation time. If False, resets omega to None!
- **write** (*bool*, *optional*) – whether to save updated ray data to disk.
- **filterviews** (*bool*, *optional*) – delete rays near sourceviews

**linear\_interp** (*vm*, *srcvals*, *destvecs*)

**static apply\_interp** (*i*, *srcvals*, *weights=None*)

**content\_interp\_wedge** (*rt*, *destvecs*, *bandwidth=10*, *srfnormtol=0.2*, *disttol=0.8*, *dp=2*, *oversample=2*, *\*\*kwargs*)

**content\_interp** (*rt*, *destvecs*, *bandwidth=10*, *srfnormtol=0.2*, *disttol=0.8*, *\*\*kwargs*)

## 4.9.2 SrcViewPoint

```
class raytraverse.lightpoint.SrcViewPoint(scene, vecs, lum, pt=0, 0, 0,
posidx=0, src='sunview', res=64,
srcomega=6.796702357283834e-05)
```

Bases: object

interface for sun view data

**static offset** (*points*, *target*)

**scene** = None

raytraverse.scene.Scene

**posidx** = None

index for point

**Type** int

**pt** = None  
point location

**Type** np.array

**src** = None  
source key

**Type** str

**raster** = None  
individual vectors that hit the source (pixels)

**Type** np.array

**lum** = None  
source luminance (average)

**Type** float

**radius** = None  
source radius

**Type** float

**property** vm

**add\_to\_img** (*img, vecs, mask=None, coefs=1, vm=None*)

**evaluate** (*sunval, vm=None, blursun=False*)

**direct\_view** (*res=80*)

### 4.9.3 CompressedPointKD

**class** raytraverse.lightpoint.CompressedPointKD (*scene, vec=None, lum=None, write=True, src=None, dist=0.0981, lerr=0.01, plotc=False, \*\*kwargs*)

Bases: raytraverse.lightpoint.lightpointkd.LightPointKD

compressed data needs special methods for making images.

can be initialized either like LightPointKD (but with required omega argument), or if 'scene' is a LightPointKD then a compressed output is calculated from the input

#### Parameters

- **scene** (*BaseScene LightpointKD*) –
- **src** (*str, optional*) – new name for src passed to LightPointKD constructor
- **dist** (*float, optional*) – `translate.theta2chord(np.pi/32)`, primary clustering distance using the birch algorithm, for lossy compression of lf. this is the maximum radius of a cluster, preserving important directional information. clustering acts on ray direction and luminance, with weight of luminance dimension controlled by the lweight parameter.
- **lerr** (*float, optional*) – min-max normalized error in luminance grouping.
- **plotc** (*bool, optional*) – make directview plot of compressed output showing source vectors

**add\_to\_img** (*img, vecs, mask=None, skyvec=1, vm=None, \*\*kwargs*)  
add luminance contributions to image array (updates in place)

#### Parameters

- **img** (*np.array*) – 2D image array to add to (either zeros or with other source)

- **vecs** (*np.array*) – vectors corresponding to img pixels shape (N, 3)
- **mask** (*np.array, optional*) – indices to img that correspond to vec (in case where whole image is not being updated, such as corners of fisheye)
- **skyvec** (*int float np.array, optional*) – source coefficients, shape is (1,) or (srcn,)
- **vm** (*raytraverse.mapper.ViewMapper, optional*) –

**compress** (*lp, src=None, dist=0.0981, lerr=0.01*)

A lossy compression based on clustering. Rays are clustered using the birch algorithm on a 4D vector (x,y,z,lum) where lum is the sum of contributions from all sources in the LightPoint. In the optional second stage (activated with secondary=True) sources are further grouped through agglomerative cluster using an average linkage. this is to help with source identification/matching between LightPoints, but can introduce significant errors to computing non energy conserving metrics in cases where the applied sky vectors have large relative differences between adjacent patches (> 1.5:1) or if the variance in peak luminance above the lthreshold parameter is significant. These include cases where nearby transmitting materials is varied (example: a trans upper above a clear lower), or lthreshold is set too low. For this reason, it is better to use single stage compression for metric computation and only do glare source grouping for interpolation between LightPoints.

#### Parameters

- **lp** (*LightPointKD*) –
- **src** (*str, optional*) – new name for src passed to LightPointKD constructor
- **dist** (*float, optional*) – `translate.theta2chord(np.pi/32)`, primary clustering distance using the birch algorithm, for lossy compression of lf. this is the maximum radius of a cluster, preserving important directional information. clustering acts on ray direction and luminance, with weight of luminance dimension controlled by the lweight parameter.
- **lerr** (*float, optional*) – min-max normalized error in luminance grouping.
- **plotc** (*bool, optional*) – make directview plot of compressed output showing source vectors

#### Returns

**Return type** arguments for initializing a CompressedPointKD

## 4.10 raytraverse.lightfield

### 4.10.1 LightField

**class** raytraverse.lightfield.LightField(*scene, vecs, pm, src*)

Bases: object

collection of light data with KDtree structure for spatial query

#### Parameters

- **scene** (*raytraverse.scene.BaseScene*) –
- **vecs** (*np.array str*) – the vectors used to organizing the child data as array or file shape (N,3) or (N,4) if 3, indexed from 0
- **pm** (*raytraverse.mapper.PlanMapper*) –
- **src** (*str*) – name of source group.

**property samplelevel**

the level at which the vec was sampled (all zero if not provided upon initialization)

**property vecs**  
indexing vectors (such as position, sun positions, etc.)

**property data**  
light data

**property kd**  
kdtree for spatial queries built on demand

**property omega**  
solid angle or area

**query** (*vecs*)  
return the index and distance of the nearest point to each of points

**Parameters** **vecs** (*np.array*) – shape (N, 3) vectors to query.

**Returns**

- **i** (*np.array*) – integer indices of closest ray to each query
- **d** (*np.array*) – distance from query to point in spacemapper.

**evaluate** (*\*args, \*\*kwargs*)

#### 4.10.2 LightPlaneKD

**class** raytraverse.lightfield.LightPlaneKD (*scene, vecs, pm, src*)  
Bases: raytraverse.lightfield.lightfield.LightField  
collection of lightpoints with KDtree structure for positional query

**property data**  
LightPointSet

**property omega**  
representative area of each point

**Getter** Returns array of areas

**Setter** sets areas

**Type** np.array

**evaluate** (*skyvec, points=None, vm=None, metricclass=<class 'raytraverse.evaluate.metricset.MetricSet'>, metrics=None, mask=True, \*\*kwargs*)

**make\_image** (*outf, vals, res=1024, interp=False, showsample=False*)  
make an image from precomputed values for every point in LightPlane

**Parameters**

- **outf** (*str*) – the file to write
- **vals** (*np.array*) – shape (len(self.points),) the values computed for each point
- **res** (*int, optional*) – image resolution (the largest dimension)
- **interp** (*bool, optional*) – apply linear interpolation, points outside convex hull of results fall back to nearest
- **showsample** (*bool, optionaal*) – color pixel at sample location red

**direct\_view** (*res=512, showsample=True, vm=None, area=False, metricclass=<class 'raytraverse.evaluate.metricset.MetricSet'>, metrics=('avglum', ), interp=False*)  
create a summary image of lightplane showing samples and areas

### 4.10.3 SunsPlaneKD

**class** raytraverse.lightfield.SunsPlaneKD (*scene, vecs, pm, src*)

Bases: raytraverse.lightfield.lightfield.LightField

collection of lightplanes with KDtree structure for sun position query

**property** vecs

indexing vectors (sx, sy, sz, px, py, pz)

**property** suns

**property** data

LightPlaneSet

**property** kd

kdtree for spatial queries built on demand

**property** sunkd

kdtree for sun position queries built on demand

**query** (*vecs*)

return the index and distance of the nearest vec to each of vecs

**Parameters** **vecs** (*np.array*) – shape (N, 6) vectors to query.

**Returns**

- **i** (*np.array*) – integer indices of closest ray to each query
- **d** (*np.array*) – distance from query to point, positional distance is normalized by the average chord-length between level 0 sun samples divided by the PlanMapper ptres \* sqrt(2).

**query\_by\_sun** (*sunvec, fixed\_points=None, ptfilter=0.25, stol=10, minsun=1*)

for finding vectors across zone, sun vector based query

**Parameters**

- **sunvec** (*Sequence*) – sun direction vector (normalized, xyz)
- **fixed\_points** (*Sequence, optional*) – 2d array like, shape (N, 3) of additional fixed points to return use for example with a matching sky query. Note that if point filter is to large not all of these points are necessarily returned.
- **ptfilter** (*Union[float, int], optional*) – minimum seperation for returned points
- **stol** (*Union[float, int], optional*) – maximum angle (in degrees) for matching sun vectors
- **minsun** (*int, optional*) – if atleast these many suns are not returned based on stol, directly query for this number of results (regardless of sun error)

**Returns**

- **vecs** (*np.array*) – shape (N, 6) final vectors, because of fixed\_points, this may not match exactly with self.vecs[i] so this array mus be used in further processing
- **i** (*np.array*) – integer indices of the closest rays to each query
- **d** (*np.array*) – angle (in degrees) between queried sunvec and returned index

**query\_by\_suns** (*sunvecs, fixed\_points=None, ptfilter=0.25, stol=10, minsun=1*)

parallel processing call to query\_by\_sun for 2d array of sunvecs

**Parameters**

- **sunvecs** (*np.array*) – shape (N, 3) sun direction vectors (normalized, xyz)

- **fixed\_points** (*Sequence, optional*) – 2d array like, shape (N, 3) of additional fixed points to return use for example with a matching sky query. Note that if point filter is to large not all of these points are necessarily returned.
- **ptfilter** (*Union[float, int], optional*) – minimum seperation for returned points
- **stol** (*Union[float, int], optional*) – maximum angle (in degrees) for matching sun vectors
- **minsun** (*int, optional*) – if atleast these many suns are not returned based on stol, directly query for this number of results (regardless of sun error)

#### Returns

- **vecs** (*list*) – list of np.array, one for each sunvec (see query\_by\_sun)
- **idx** (*list*) – list of np.array, one for each sunvec (see query\_by\_sun)
- **d** (*list*) – list of np.array, one for each sunvec (see query\_by\_sun)

### 4.10.4 LightResult

**class** raytraverse.lightfield.**LightResult** (*data, \*axes*)

Bases: object

a dense representation of lightfield data analyzed for a set of metrics

this class handles writing and loading results to disk as binary data and intuitive result extraction and reshaping for downstream visualisation and analysis using one of the “pull” methods. axes are indexed both numerically and names for increased transparency and ease of use.

#### Parameters

- **data** (*np.array str*) – multidimensional array of result data or file path to saved LightResule
- **axes** (*Sequence[raytraverse.lightfield.ResultAxis]*) – axis information

**property data**

**property axes**

**property names**

**property file**

**axis** (*name*)

**load** (*file*)

**write** (*file, compressed=True*)

**pull** (*\*axes, preserve=1, \*\*kwargs*)

arrange and extract data slices from result.

Integrators construct a light result with these axes:

0. sky
1. point
2. view
3. metric

#### Parameters

- **axes** (*Union[int, str]*) – the axes (by name or integer index) to reorder output, list will fill with default object order.
- **preserve** (*int, optional*) – number of dimensions to preserve (result will be N+1).
- **kwargs** (*dict, optional*) – keys with axis names will be used to filter output.

#### Returns

- **result** (*np.array*) – the result array, will have 1+len(axes) dims, with the shaped determined by axis size and any indices argument.
- **labels** (*Sequence*) – list of labels for each axis, for flattened axes will be a tuple of broadcast axis labels.
- **names** (*Sequence*) – list of strings of returned axis names

```
static row_labels (labels)
static fmt_names (name, labels)
pull_header (names, labels, rowlabel=True)
print (col, header=True, rowlabel=True, file=None, skyfill=None, **kwargs)
    first calls pull and then prints 2d result to file
sky_percentile (metric, per=50, **kwargs)
print_serial (col, basename, header=True, rowlabel=True, skyfill=None, **kwargs)
    print 3d result to series of 2d files
pull2hdr (col, basename, skyfill=None, spd=24, pm=None, **kwargs)
info ()
```

### 4.10.5 ZonalLightResult

```
class raytraverse.lightfield.ZonalLightResult (data, *axes, pointmetrics=None)
    Bases: raytraverse.lightfield.lightresult.LightResult

    a semi-dense representation of lightfield data analyzed for a set of metrics

    this class handles writing and loading results to disk as binary data and intuitive result extraction and re-
    shaping for downstream visualisation and analysis using one of the “pull” methods. axes are indexed both
    numerically and names for increased transparency and ease of use.

    property data

    load (file)

    write (file, compressed=True)

    pull2hdr (imgzone, basename, **kwargs)
```

### 4.10.6 sets

#### LightSet

```
class raytraverse.lightfield.sets.LightSet (dataclass, scene, points, idx, **kwargs)
    Bases: object
```

## LightPointSet

**class** raytraverse.lightfield.sets.**LightPointSet** (*scene, points, idx, src, parent*)

Bases: *raytraverse.lightfield.sets.LightSet*

a collection of LightPoints, initialized by getitem

## MultiLightPointSet

**class** raytraverse.lightfield.sets.**MultiLightPointSet** (*scene, points, idx, src, parent*)

Bases: *raytraverse.lightfield.sets.LightSet*

## 4.10.7 RaggedResult

**class** raytraverse.lightfield.**RaggedResult** (*a*)

Bases: tuple

has a shape parameter and indexing similar to a np.array, but with varying shape along the second axis. composed of a list of np.arrays whose shape match after the first dimension.

## 4.10.8 ResultAxis

**class** raytraverse.lightfield.**ResultAxis** (*values, name, cols=None*)

Bases: object

**property cols**

## 4.11 raytraverse.integrator

### 4.11.1 Integrator

**class** raytraverse.integrator.**Integrator** (*\*lightplanes, includesky=True, includesun=True, sunviewengine=None*)

Bases: object

collection of lightplanes with KDtree structure for sun position query

**Parameters lightplanes** (*Sequence[raytraverse.lightfield.LightPlaneKD]*) –

**evaluate\_pt** (*skyvecs, suns, vm=None, vms=None, metricclass=None, metrics=None, srconly=False, sumsafe=False, suntol=1.0, svengine=None, blursun=False, refl=None, resamprad=0.0, \*\*kwargs*)  
point by point evaluation suitable for submitting to ProcessPool

**img\_pt** (*skyvecs, suns, vms=None, combos=None, qpts=None, skinfo=None, res=512, interp=False, prefix='img', suntol=1.0, svengine=None, refl=None, resamprad=0.0, \*\*kwargs*)  
point by point evaluation suitable for submitting to ProcessPool

**make\_images** (*skydata, points, vm, viewangle=180.0, res=512, interp=False, prefix='img', namebyindex=False, suntol=10.0, blursun=False, resamprad=0.0*)  
see namebyindex for file naming conventions

**Parameters**

- **skydata** (*raytraverse.sky.Skydata*) –
- **points** (*np.array*) – shape (N, 3)

- **vm** (*Union[raytraverse.mapper.ViewMapper, np.array]*) – either a predefined ViewMapper (used for all points) or an array of view directions (will use a 180 degree view angle when initializing ViewMapper)
- **viewangle** (*float, optional*) – view opening for sensor (0-180,360) when vm is given as an array of view directions.
- **res** (*int, optional*) – image resolution
- **interp** (*bool, optional*) – interpolate image
- **prefix** (*str, optional*) – prefix for output file naming
- **namebyindex** (*bool, optional*) – if False (default), names images by: <prefix>\_sky-<row>\_pt-<x>\_<y>\_<z>\_vd-<dx>\_<dy>\_<dz>.hdr if True, names images by: <prefix>\_sky-<row>\_pt-<pidx>\_vd-<vidx>.hdr, where pidx, vidx are refer to the order of points, and vm.

### Returns

**Return type** np.array of out\_files shape (skies, points, views)

**evaluate** (*skydata, points, vm, viewangle=180.0, metricclass=<class 'raytraverse.evaluate.metricset.MetricSet'>, metrics=None, datainfo=False, sronly=False, suntol=10.0, blursun=False, coercesumsafe=False, \*\*kwargs*)  
apply sky data and view queries to daylightplane to return metrics parallelizes and optimizes run order.

### Parameters

- **skydata** (*raytraverse.sky.Skydata*) –
- **points** (*np.array*) – shape (N, 3)
- **vm** (*Union[raytraverse.mapper.ViewMapper, np.array]*) – either a predefined ViewMapper (used for all points) or an array of view directions (will use ‘viewangle’ when initializing ViewMapper)
- **viewangle** (*float, optional*) – view opening for sensor (0-180,360) when vm is given as an array of view directions, note that for illuminance based metrics, a value of 360 may not make sense as values behind will be negative.
- **metricclass** (*raytraverse.evaluate.BaseMetricSet, optional*) –
- **metrics** (*Sized, optional*) –
- **sronly** (*bool, optional*) – sun only calculations
- **suntol** (*float, optional*) – if Integrator has an engine, resample sun views when actual sun position error is greater than this many degrees.
- **blursun** (*bool, optional*) – apply human PSF to small bright sources
- **coercesumsafe** (*bool, optional*) – attempt to calculate sumsafe metrics
- **datainfo** (*Union[Sized[str], bool], optional*) – include information about source data as additional metrics. Valid values include: [“pt\_err”, “pt\_idx”, “src\_err”, “src\_idx”]. If True, includes all.

### Returns

**Return type** *raytraverse.lightfield.LightResult*

### 4.11.2 IntegratorDS

**class** raytraverse.integrator.**IntegratorDS** (*skplane, dskplane, snplane, sunviewengine=None*)

Bases: raytraverse.integrator.integrator.Integrator

specialized integrator for 2-phase DDS style calculation. assumes first lightplane is sky contribution, second, direct sky contribution (with identical sampling to sky) and third direct sun contribution. Uses special point functions that combine two sky functions on a per patch basis.

#### Parameters

- **skplane** (raytraverse.lightfield.LightPlaneKD) –
- **snplane** (raytraverse.lightfield.SunsPlaneKD) –
- **dskplane** (raytraverse.lightfield.LightPlaneKD) –

**evaluate\_pt** (*skyvecs, suns, \*\*kwargs*)

**img\_pt** (*skyvecs, suns, \*\*kwargs*)

### 4.11.3 IntegratorDV

**class** raytraverse.integrator.**IntegratorDV** (*skplane, dskplane, sunviewengine*)

Bases: raytraverse.integrator.integrator.Integrator

specialized integrator for 2-phase Direct Views style calculation. assumes first lightplane is sky contribution, second, direct sky contribution. Uses special point functions that combine two sky functions on a per patch basis.

#### Parameters

- **skplane** (raytraverse.lightfield.LightPlaneKD) –
- **dskplane** (raytraverse.lightfield.LightPlaneKD) –

**evaluate\_pt** (*skyvecs, suns, \*\*kwargs*)

**img\_pt** (*skyvecs, suns, \*\*kwargs*)

### 4.11.4 ZonalIntegrator

**class** raytraverse.integrator.**ZonalIntegrator** (*\*lightplanes, includesky=True, includesun=True, sunviewengine=None*)

Bases: raytraverse.integrator.integrator.Integrator

**evaluate** (*skydata, pm, vm, viewangle=180.0, metricclass=<class 'raytraverse.evaluate.metricset.MetricSet'>, metrics=None, sronly=False, ptfilter=0.25, stol=10, minsun=1, datainfo=False, \*\*kwargs*)

apply sky data and view queries to daylightplane to return metrics parallelizes and optimizes run order.

#### Parameters

- **skydata** (raytraverse.sky.Skydata) –
- **pm** (raytraverse.mapper.PlanMapper) –
- **vm** (*Union[raytraverse.mapper.ViewMapper, np.array]*) – either a predefined ViewMapper (used for all points) or an array of view directions (will use ‘viewangle’ when initializing ViewMapper)
- **viewangle** (*float, optional*) – view opening for sensor (0-180,360) when vm is given as an array of view directions, note that for illuminance based metrics, a value of 360 may not make sense as values behind will be negative.

- **metricclass** (`raytraverse.evaluate.BaseMetricSet`, *optional*) –
- **metrics** (*Sized*, *optional*) –
- **srconly** (*bool*, *optional*) – sun only calculations
- **ptfilter** (`Union[float, int]`, *optional*) – minimum separation for returned points
- **stol** (`Union[float, int]`, *optional*) – maximum angle (in degrees) for matching sun vectors
- **minsun** (*int*, *optional*) – if atleast these many suns are not returned based on stol, directly query for this number of results (regardless of sun error)
- **datainfo** (`Union[Sized[str], bool]`, *optional*) – include information about source data as additional metrics. Valid values include: ["src\_err", "src\_idx"]. If True, includes both.

#### Returns

**Return type** `raytraverse.lightfield.LightResultKD`

### 4.11.5 ZonalIntegratorDS

```
class raytraverse.integrator.ZonalIntegratorDS(skplane, dskplane, snplane, sun-  
                                              viewengine=None)  
Bases: raytraverse.integrator.integrators.IntegratorDS, raytraverse.  
integrator.zonalintegrator.ZonalIntegrator
```

specialized integrator for 2-phase DDS style calculation. assumes first lightplane is sky contribution, second, direct sky contribution (with identical sampling to sky) and third direct sun contribution. Uses special point functions that combine two sky functions on a per patch basis.

## 4.12 raytraverse.evaluate

### 4.12.1 BaseMetricSet

```
class raytraverse.evaluate.BaseMetricSet(vec, omega, lum, vm, metricset=None,  
                                         scale=179.0, omega_as_view_area=True,  
                                         guth=True, warnings=False, **kwargs)
```

Bases: `object`

object for calculating metrics based on a view direction, and rays consisting on direction, solid angle and luminance information

by encapsulating these calculations within a class, metrics with redundant calculations can take advantage of cached results, for example `dgp` does not need to recalculate illuminance when it has been directly requested. all metrics can be accessed as properties (and are calculated just in time) or the object can be called (no arguments) to return a `np.array` of all metrics defined in "metricset"

#### Parameters

- **vm** (`raytraverse.mapper.ViewMapper`) – the view direction
- **vec** (`np.array`) – (N, 3) directions of all rays in view
- **omega** (`np.array`) – (N,) solid angle of all rays in view
- **lum** (`np.array`) – (N,) luminance of all rays in view (multiplied by "scale")
- **metricset** (*list*, *optional*) – keys of metrics to return, same as property names

- **scale** (*float, optional*) – scalefactor for luminance
- **omega\_as\_view\_area** (*bool, optional*) – take sum(omega) as view area. if false corrects omega to vm.area
- **warnings** (*bool, optional*) – if False, suppresses numpy warnings (zero div, etc...) when accessed via `__call__`
- **kwargs** – additional arguments that may be required by additional properties

**allmetrics** = ['illum', 'avglum', 'loggcr', 'gcr', 'pwgcr', 'logpwgcr', 'density', 'a

**safe2sum** = {'avglum', 'density', 'illum'}

**defaultmetrics** = ['illum', 'avglum', 'loggcr']

available metrics (and the default return set)

**classmethod check\_metrics** (*metrics, raise\_error=False*)

returns list of valid metric names from argument if raise\_error is True, raises an Attribute Error

**classmethod check\_safe2sum** (*metrics*)

checks if list if metrics is safe to compute for separate sources before adding

**property vec**

**property lum**

**property omega**

**property ctheta**

cos angle between ray and view

**property radians**

angle between ray and view

**property pos\_idx**

**property pweight**

**property pweighted\_area**

**property illum**

illuminance

**property avglum**

average luminance

**property maxlum**

average luminance

**property pwavglum**

position weighted average luminance

**property avgraylum**

average luminance (not weighted by omega)

**property gcr**

a unitless measure of relative contrast defined as the average of the squared luminances divided by the average luminance squared

**property pwgcr**

a unitless measure of relative contrast defined as the average of the squared luminances divided by the average luminance squared weighted by a position index

**property logpwgcr**

a unitless measure of relative contrast defined as the log of gcr

**property loggcr**

a unitless measure of relative contrast defined as the log of gcr

**property density**

### 4.12.2 MultiLumMetricSet

```
class raytraverse.evaluate.MultiLumMetricSet (vec, omega, lum, vm, met-  
ricset=None, scale=179.0,  
omega_as_view_area=True,  
**kwargs)
```

Bases: raytraverse.evaluate.basemetricset.BaseMetricSet

object for calculating metrics based on a view direction, and rays consisting on direction, solid angle and luminance information

by encapsulating these calculations within a class, metrics with redundant calculations can take advantage of cached results, for example `dgp` does not need to recalculate illuminance when it has been directly requested. all metrics can be accessed as properties (and are calculated just in time) or the object can be called (no arguments) to return a `np.array` of all metrics defined in “metricset”

#### Parameters

- **vm** (`raytraverse.mapper.ViewMapper`) – the view direction
- **vec** (`np.array`) – (N, 3) directions of all rays in view
- **omega** (`np.array`) – (N,) solid angle of all rays in view
- **lum** (`np.array`) – (N, M) luminance of all rays in view (multiplied by “scale”)
- **metricset** (`list, optional`) – keys of metrics to return, same as property names
- **scale** (`float, optional`) – scalefactor for luminance
- **kwargs** – additional arguments that may be required by additional properties

**property illum**  
illuminance

**property avglum**  
average luminance

**property avgraylum**  
average luminance (not weighted by omega)

**property gcr**  
a unitless measure of relative contrast defined as the average of the squared luminances divided by the average luminance squared

### 4.12.3 MetricSet

```
class raytraverse.evaluate.MetricSet (vec, omega, lum, vm, metricset=None, scale=179.0,  
threshold=2000.0, guth=True, tradius=30.0,  
omega_as_view_area=False, lowlight=False,  
**kwargs)
```

Bases: raytraverse.evaluate.basemetricset.BaseMetricSet

object for calculating metrics based on a view direction, and rays consisting on direction, solid angle and luminance information

by encapsulating these calculations within a class, metrics with redundant calculations can take advantage of cached results, for example `dgp` does not need to recalculate illuminance when it has been directly requested. all metrics can be accessed as properties (and are calculated just in time) or the object can be called (no arguments) to return a `np.array` of all metrics defined in “metricset”

#### Parameters

- **vm** (`raytraverse.mapper.ViewMapper`) – the view direction
- **vec** (`np.array`) – (N, 3) directions of all rays in view

- **omega** (*np.array*) – (N,) solid angle of all rays in view
- **lum** (*np.array*) – (N,) luminance of all rays in view (multiplied by “scale”)
- **metricset** (*list, optional*) – keys of metrics to return, same as property names
- **scale** (*float, optional*) – scalefactor for luminance
- **threshold** (*float, optional*) – threshold for glaresource/background similar behavior to evalglare ‘-b’ parameter. if greater than 100 used as a fixed luminance threshold. otherwise used as a factor times the task luminance (defined by ‘tradius’)
- **guth** (*bool, optional*) – if True, use Guth for the upper field of view and iwata for the lower if False, use Kim
- **tradius** (*float, optional*) – radius in degrees for task luminance calculation
- **kwargs** – additional arguments that may be required by additional properties

**defaultmetrics** = ['illum', 'avglum', 'loggcr', 'ugp', 'dgp']  
available metrics (and the default return set)

**allmetrics** = ['illum', 'avglum', 'loggcr', 'gcr', 'pwgcr', 'logpwgcr', 'density', 'a

**safe2sum** = {'avglum', 'density', 'illum', 'pws12', 'srcillum'}

**property src\_mask**  
boolean mask for filtering source/background rays

**property task\_mask**

**property sources**  
vec, omega, lum of rays above threshold

**property background**  
vec, omega, lum of rays below threshold

**property source\_pos\_idx**

**property threshold**  
threshold for glaresource/background similar behavior to evalglare ‘-b’ parameter

**property pws12**  
position weighted source luminance squared, used by dgp, ugr, etc  $\sum(L_s^2 \cdot \omega / P_s^2)$

**property srcillum**  
source illuminance

**property srcarea**  
total source area

**property maxlum**  
peak luminance

**property backlum**  
average background luminance CIE estimate (official for some metrics)

**property backlum\_true**  
average background luminance mathematical

**property tasklum**  
average task luminance

**property dgp**

**property dgp\_t1**

**property log\_gc**

**property dgp\_t2**

**property** `ugr`

**property** `ugp`

`//dx.doi.org/10.1016/j.buildenv.2016.08.005`

**Type** `http`

#### 4.12.4 FieldMetric

```
class raytraverse.evaluate.FieldMetric(vec, omega, lum, vm=None, scale=1.0,  
                                         npts=360, close=True, sigma=0.05,  
                                         omega_as_view_area=True, **kwargs)
```

Bases: `raytraverse.evaluate.basemetricset.BaseMetricSet`

calculate metrics on full spherical point clouds rather than view based metrics.

##### Parameters

- **vec** (*np.array*) – (N, 3) directions of all rays
- **omega** (*np.array*) – (N,) solid angle of all rays
- **lum** (*np.array*) – (N,) luminance of all rays (multiplied by “scale”)
- **metricset** (*list, optional*) – keys of metrics to return, same as property names
- **scale** (*float, optional*) – scalefactor for luminance
- **npts** (*int, optional*) – for equatorial metrics, the number of points to interpolate
- **close** (*bool, optional*) – include npts+1 duplicate to draw closed curve
- **sigma** (*float, optional*) – scale parameter of gaussian for kernel estimated metrics
- **omega\_as\_view\_area** (*bool, optional*) – set to true when vectors either represent a whole sphere or a subset that does not match the viewmapper. if False, corrects boundary omega to properly trim to correct size.
- **kwargs** – additional arguments that may be required by additional properties

**property** `tp`

vectors in spherical coordinates

**property** `phi`

interpolated output phi values

**property** `eq_xyz`

interpolated output xyz vectors

**property** `avg`

overall vector (with magnitude)

**property** `peak`

overall vector (with magnitude)

**property** `eq_lum`

luminance along an interpolated equator with a bandwidth=sigma

**property** `eq_density`

ray density along an interpolated equator

**property** `eq_illum`

illuminance along an interpolated equator

**property** `eq_gcr`

cosine weighted gcr along an interpolated equator

```
property eq_loggc
property eq_dgp
```

### 4.12.5 SamplingMetrics

```
class raytraverse.evaluate.SamplingMetrics(vec, omega, lum, vm, scale=1.0, peak-
                                         threshold=0.0, lmin=0, gcrnorm=8,
                                         **kwargs)
```

Bases: raytraverse.evaluate.basemetricset.BaseMetricSet

default metricset for areasampler

```
defaultmetrics = ['avglum', 'loggcr', 'xpeak', 'ypeak']
    available metrics (and the default return set)
```

```
allmetrics = ['avglum', 'loggcr', 'xpeak', 'ypeak']
```

```
property peakvec
    average vector (with magnitude) for peak rays
```

```
property xpeak
    x-component of avgvec as positive number (in range 0-1)
```

```
property ypeak
    y-component of avgvec as positive number (in range 0-1)
```

```
property loggcr
    log of global contrast ratio
```

### 4.12.6 PositionIndex

```
class raytraverse.evaluate.PositionIndex(guth=True)
```

Bases: object

calculate position index according to guth/iwata or kim

**Parameters** *guth* (*bool*) – if True, use Guth for the upper field of view and iwata for the lower if False, use Kim

```
positions (vm, vec)
    calculate position indices for a set of vectors
```

**Parameters**

- **vm** (*raytraverse.mapper.ViewMapper*) – the view/analysis point, should have 180 degree field of view
- **vec** (*np.array*) – shape (N,3) the view vectors to calculate

**Returns** *posidx* – shape (N,) the position indices

**Return type** *np.array*

```
positions_vec (viewvec, srcvec, up=0, 0, 1)
```

## 4.12.7 retina

`raytraverse.evaluate.retina.hpsf(x, fwhm=0.183333)`

estimate of human eye point-spread function

from: Yang, Yr., Wanek, J. & Shahidi, M. Representing the retinal line spread shape with mathematical functions. J. Zhejiang Univ. Sci. B 9, 996–1002 (2008). <https://doi.org/10.1631/jzus.B0820184>

`raytraverse.evaluate.retina.inv_hpsf(y, fwhm=0.183333)`

inverse of hpsf

`raytraverse.evaluate.retina.blur_sun(omega, lmax, lmin=279.33, fwhm=0.183333)`

calculate source correction to small bright source

returned value should be multiplied by omega and divides luminance

### Parameters

- **omega** (*Union[float, np.array]*) – solid angle in steradians of source
- **lmax** (*Union[float, np.array]*) – maximum radiance in source ( $\text{cd/m}^2$ )/179
- **lmin** (*Union[float, np.array], optional*) – minimum radiance value to gather after spread (mimic peak extraction of evalglare, but note the different units ( $\text{cd/m}^2$ )/179
- **fwhm** (*Union[float, np.array], optional*) – full width half max of Lorentzian curve (radius in degrees) default is 11 arcmin.

**Returns** **correction factor** – value should be multiplied by omega and divides luminance

**Return type** *Union[float, np.array]*

`raytraverse.evaluate.retina.rgcf_density_on_meridian(deg, mi)`

retinal ganglion cell field density along a meridian as a functional best fit.

the field density accounts for the input region of the ganglion cell to account for displaced ganglion cells. This value is estimate from cone density and the inferred density of midget ganglion cells. see Watson (2014) for important caveats.

### Parameters

- **deg** (*np.array*) – eccentricity in degrees along meridian
- **mi** (*int*) – meridian index. [0, 1, 2, 3] for Temporal, Superior, Nasal, Inferior.

**Returns** 1d array of retinal ganglion cell density along a meridian

**Return type** *np.array*

`raytraverse.evaluate.retina.rgc_density_on_meridian(deg, mi)`

retinal ganglion cell density along a meridian as a linear interpolation between non-zero measurements

As opposed to the field density this estimate the actual location of ganglion cells, which could be important to consider for intrinsically photosensitive cells. These are (partially?) responsible for pupillary response. However, even iprgc (may?) receive signals from rods/cones

### Parameters

- **deg** (*np.array*) – eccentricity in degrees along meridian
- **mi** (*int*) – meridian index. [0, 1, 2, 3] for Temporal, Superior, Nasal, Inferior.

**Returns** 1d array of retinal ganglion cell density along a meridian

**Return type** *np.array*

`raytraverse.evaluate.retina.rgcf_density_xy(xy, func=<function  
rgcf_density_on_meridian>)`

interpolate density between meridia, selected by quadrant

### Parameters

- **xy** (*np.array*) – xy visual field coordinates on a disk in degrees (eccentricity 0-90 from fovea)
- **func** (*callable*) – density function along a meridian, takes r in degrees and an axes index: [0, 1, 2, 3] for Temporal, Superior, Nasal, Inferior.

**Returns** 1d array of single eye densities

**Return type** np.array

`raytraverse.evaluate.retina.binocular_density(xy, func=<function  
rgcf_density_on_meridian>)`  
average density between both eyes.

#### Parameters

- **xy** (*np.array*) – xy visual field coordinates on a disk (eccentricity 0-1 from fovea)
- **func** (*callable*) – density function along a meridian, takes r in degrees and an axes index: [0, 1, 2, 3] for Temporal, Superior, Nasal, Inferior. coordinates are for the visual field.

**Returns** 1d array of average binocular densities

**Return type** np.array

`raytraverse.evaluate.retina.rgcf_density(xy)`  
retinal ganglion cell field density

**Parameters** **xy** (*np.array*) – xy visual field coordinates on a disk (eccentricity 0-1 from fovea)

**Returns** 1d array retinal ganglion cell field density according to model by Watson

**Return type** np.array

`raytraverse.evaluate.retina.rgc_density(xy)`  
retinal ganglion cell density (includes displaced ganglion cells)

**Parameters** **xy** (*np.array*) – xy visual field coordinates on a disk (eccentricity 0-1 from fovea)

**Returns** 1d array retinal ganglion cell density according to measurements by Curcio

**Return type** np.array

## 4.13 raytraverse.craytraverse

## 4.14 raytraverse.io

functions for reading and writing

`raytraverse.io.get_nproc(nproc=None)`

`raytraverse.io.set_nproc(nproc)`

`raytraverse.io.unset_nproc()`

`raytraverse.io.np2bytes(ar, dtype='<f')`  
format ar as bytestring

#### Parameters

- **ar** (*np.array*) –
- **dtype** (*str*) – argument to pass to np.dtype()

**Returns**

**Return type** bytes

`raytraverse.io.numpy2bytefile (ar, outf, dtype='<f', mode='wb')`  
save vectors to file

**Parameters**

- **ar** (`np.array`) – array to write
- **outf** (`str`) – file to write to
- **dtype** (`str`) – argument to pass to `np.dtype()`

`raytraverse.io.bytes2np (buf, shape, dtype='<f')`  
read ar from bytestring

**Parameters**

- **buf** (`bytes`, `str`) –
- **shape** (`tuple`) – array shape
- **dtype** (`str`) – argument to pass to `np.dtype()`

**Returns**

**Return type** `np.array`

`raytraverse.io.bytefile2np (f, shape, dtype='<f')`  
read binary data from f

**Parameters**

- **f** (`IOBase`) – file object to read array from
- **shape** (`tuple`) – array shape
- **dtype** (`str`) – argument to pass to `np.dtype()`

**Returns** necessary for reconstruction

**Return type** `ar.shape`

`raytraverse.io.version_header ()`  
generate image header string

`raytraverse.io.array2hdr (ar, imgf, header=None)`  
write 2d `np.array` (x,y) to hdr image format

**Parameters**

- **ar** (`np.array`) – image array
- **imgf** (`str`) – file path to right
- **header** (`list`) – list of header lines to append to image header

**Returns**

**Return type** `imgf`

`raytraverse.io.carray2hdr (ar, imgf, header=None)`  
write color channel `np.array` (3, x, y) to hdr image format

**Parameters**

- **ar** (`np.array`) – image array
- **imgf** (`str`) – file path to right
- **header** (`list`) – list of header lines to append to image header

**Returns**

**Return type** `imgf`

`raytraverse.io.hdr2array (imgf, stdin=None)`  
 read np.array from hdr image

**Parameters**

- **imgf** (*file path of image*) –
- **stdin** – passed to Popen (imgf should be “”)

**Returns** **ar**

**Return type** np.array

`raytraverse.io.hdr2carray (imgf, stdin=None)`  
 read np.array from color hdr image

**Parameters**

- **imgf** (*file path of image*) –
- **stdin** – passed to Popen (imgf should be “”)

**Returns** **ar**

**Return type** np.array

`raytraverse.io.rgb2rad (rgb)`

`raytraverse.io.rgb2lum (rgb)`

`raytraverse.io.rgbe2lum (rgbe)`  
 convert from Radiance hdr rgbe 4-byte data format to floating point luminance.

**Parameters** **rgbe** (*np.array*) – r,g,b,e unsigned integers according to: <http://radsite.lbl.gov/radiance/refer/filefmts.pdf>

**Returns** **lum**

**Return type** luminance in cd/m<sup>2</sup>

## 4.15 raytraverse.translate

functions for translating between coordinate spaces and resolutions

`raytraverse.translate.norm (v)`  
 normalize 2D array of vectors along last dimension

`raytraverse.translate.norm1 (v)`  
 normalize flat vector

`raytraverse.translate.uv2xy (uv)`  
 translate from unit square (0,1),(0,1) to disk (x,y) <http://psgraphics.blogspot.com/2011/01/improved-code-for-concentric-map.html>.

`raytraverse.translate.uv2xyz (uv, axes=0, 1, 2, xsign=1)`  
 translate from 2 x unit square (0,2),(0,1) to unit sphere (x,y,z) <http://psgraphics.blogspot.com/2011/01/improved-code-for-concentric-map.html>.

`raytraverse.translate.xyz2uv (xyz, normalize=False, axes=0, 1, 2, flipu=False)`  
 translate from vector x,y,z (normalized) to u,v (0,2),(0,1) Shirley, Peter, and Kenneth Chiu. A Low Distortion Map Between Disk and Square. Journal of Graphics Tools, vol. 2, no. 3, Jan. 1997, pp. 45-52. Taylor and Francis+NEJM, doi:10.1080/10867651.1997.10487479.

`raytraverse.translate.xyz2skybin (xyz, side, tol=0, normalize=False)`

`raytraverse.translate.skybin2xyz (bn, side)`  
 generate source vectors from sky bins

**Parameters**

- **bn** (*np.array*) – bin numbers
- **side** (*int*) – square side of discretization

**Returns** **xyz** – direction to center of sky patches

**Return type** *np.array*

`raytraverse.translate.xyz2xy(xyz, axes=0, 1, 2, flip=False)`  
xyz coordinates to xy mapping of angular fisheye proejection

`raytraverse.translate.tpnorm(thetaphi)`  
normalize angular vector to 0-pi, 0-2pi

`raytraverse.translate.tp2xyz(thetaphi, normalize=True)`  
calculate x,y,z vector from theta (0-pi) and phi (0-2pi) RHS Z-up

`raytraverse.translate.xyz2tp(xyz)`  
calculate theta (0-pi), phi from x,y,z RHS Z-up

`raytraverse.translate.tp2uv(thetaphi)`  
calculate UV from theta (0-pi), phi

`raytraverse.translate.uv2tp(uv)`  
calculate theta (0-pi), phi from UV

`raytraverse.translate.aa2xyz(aa)`  
calculate altitude (0-90), azimuth (-180,180) from xyz

`raytraverse.translate.xyz2aa(xyz)`  
calculate xyz from altitude (0-90), azimuth (-180,180)

`raytraverse.translate.chord2theta(c)`  
compute angle from chord on unit circle

**Parameters** **c** (*float*) – chord or euclidean distance between normalized direction vectors

**Returns** **theta** – angle captured by chord

**Return type** *float*

`raytraverse.translate.theta2chord(theta)`  
compute chord length on unit sphere from angle

**Parameters** **theta** (*float*) – angle

**Returns** **c** – chord or euclidean distance between normalized direction vectors

**Return type** *float*

`raytraverse.translate.ctheta(a, b)`  
cos(theta) (dot product) between a and b

`raytraverse.translate.radians(a, b)`  
angle in radians between a and b

`raytraverse.translate.degrees(a, b)`  
angle in degrees between a and b

`raytraverse.translate.uv2ij(uv, side, aspect=2)`

`raytraverse.translate.uv2bin(uv, side)`

`raytraverse.translate.bin2uv(bn, side, offset=0.5)`

`raytraverse.translate.resample(samps, ts=None, gauss=True, radius=None)`  
simple array resampling. requires whole number multiple scaling.

**Parameters**

- **samps** (*np.array*) – array to resample along each axis
- **ts** (*tuple, optional*) – shape of output array, should be multiple of samps.shape

- **gauss** (*bool*, *optional*) – apply gaussian filter to upsampling
- **radius** (*float*, *optional*) – when gauss is True, filter radius, default is the scale ratio - 1

**Returns** to resampled array

**Return type** np.array

`raytraverse.translate.rmtx_elem(theta, axis=2, degrees=True)`

`raytraverse.translate.rotate_elem(v, theta, axis=2, degrees=True)`

`raytraverse.translate.rmtx_yp(v)`

generate a pair of rotation matrices to transform from vector *v* to *z*, enforcing a *z*-up in the source space and a *y*-up in the destination. If *v* is *z*, returns pair of identity matrices, if *v* is *-z* returns pair of 180 degree rotation matrices.

**Parameters** *v* (*array-like of size (N, 3)*) – the vector direction representing the starting coordinate space

**Returns** *ymtx*, *pmtx* – two rotation matrices to be premultiplied in order to reverse transform, swap order and transpose.

**Return type** (np.array, np.array)

## Notes

if *N* is one: Forward: `(pmtx@(ymtx@xyz.T)).T` or `np.einsum("ij,kj,li->kl", ymtx, xyz, pmtx)`  
 Backward: `(ymtx.T@(pmtx.T@xyz.T)).T` or `np.einsum("ji,kj,il-kl", pmtx, nv, ymtx)` else: Forward:  
`np.einsum("vij,vkj,vli->vkl", ymtx, xyz, pmtx)` Backward: `np.einsum("vji,vkj,vil-vkl", pmtx, nv, ymtx)`

`raytraverse.translate.cull_vectors(vecs, tol)`

return mask to cull duplicate vectors within tolerance

**Parameters**

- **vecs** (*Union[KDTree, np.array]*) – prebuilt KDTree or np.array to build a new one. culling keeps first vector in array used to build tree.
- **tol** (*float*) – tolerance for culling

**Returns** boolean mask of vecs (or vecs.data) to cull vectors

**Return type** np.array

`raytraverse.translate.reflect(ray, normal, returnmasked=False)`

## 4.16 raytraverse.utility

`raytraverse.utility.utility.pool_call(func, args, *fixed_args, cap=None, expandarg=True, desc='processing', workers=True, pbar=True, **kwargs)`

calls *func* for a sequence of arguments using a *ProcessPool* executor and a progress bar. result is equivalent to:

```
result = []
for arg in args:
    result.append(func(*args, *fixed_args, **kwargs))
return result
```

**Parameters**

- **func** (*callable*) – the function to execute in parallel

- **args** (*Sequence[Sequence]*) – list of arguments (each item is expanded with ‘\*’ unless `expandarg` is false). first N args of func
- **fixed\_args** (*Sequence*) – arguments passed to func that are the same for all calls (next N arguments after args)
- **cap** (*int, optional*) – execution cap for ProcessPool
- **expandarg** (*bool, optional*) – expand args with ‘\*’ when calling func
- **desc** (*str, optional*) – label for progress bar
- **kwargs** – additional keyword arguments passed to func

#### Returns

**Return type** sequence of results from func (order preserved)

### 4.16.1 imagetools

functions for translating from mappers to hdr

```
raytraverse.utility.imagetools.uvarray2hdr (uvarray, imgf, header=None)
raytraverse.utility.imagetools.hdr2uvarray (imgf, vm=None, res=None)
raytraverse.utility.imagetools.hdr2vol (imgf, vm=None)
raytraverse.utility.imagetools.hdr2vm (imgf, vpt=False)
raytraverse.utility.imagetools.normalize_peak (v, o, l, scale=179, peaka=6.7967e-05,
                                                peakt=100000.0, peakr=4, blur-sun=False)
raytraverse.utility.imagetools.imgmetric (imgf, metrics, peakn=False, scale=179,
                                           threshold=2000.0, lowlight=False, **peakwargs)
raytraverse.utility.imagetools.img21f (imga, imgb, src, scn)
```

### 4.16.2 cli

```
raytraverse.utility.cli.np_load (ctx, param, s)
    read np array from command line

    trys np.load (numpy binary), then np.loadtxt (space separated txt file) then split row by spaces and columns
    by commas.

raytraverse.utility.cli.np_load_safe (ctx, param, s)
raytraverse.utility.cli.shared_pull (ctx, lr=None, col='metric', ofiles=None, pt-
                                     filter=None, viewfilter=None, skyfilter=None,
                                     imgfilter=None, metricfilter=None, skyfill=None,
                                     header=True, spd=24, rowlabel=True, info=False,
                                     gridhdr=False, imgzone=None, **kwargs)
    used by both raytraverse.cli and raytu, add pull_decs and clk.command_decs as clk.shared_decs in main
    script so click can properly load options
```

### 4.16.3 TStqdm

**class** raytraverse.utility.**TStqdm** (*instance=None, tz=None, workers=False, position=0, desc=None, ncols=100, cap=None, \*\*kwargs*)

Bases: `tqdm.std.tqdm`

**ts\_message** (*s*)

**write** (*s, file=None, end='\n', nlock=False*)

Print a message via tqdm (without overlap with bars).

**set\_description** (*desc=None, refresh=True*)

Set/modify description of the progress bar.

#### Parameters

- **desc** (*str, optional*) –
- **refresh** (*bool, optional*) – Forces refresh [default: True].

## 4.17 raytraverse.api

factory functions for easy api access raytraverse.

**raytraverse.api.auto\_reload** (*scndir, area, areaname='plan', skydata='skydata', ptres=1.0, rotation=0.0, zheight=None*)

reload associated class instances from file paths

#### Parameters

- **scndir** (*str*) – matches outdir argument of Scene()
- **area** (*str np.array*) – radiance scene geometry defining a plane to sample, tsv file of points to generate bounding box, or np.array of points.
- **areaname** (*str, optional*) – matches name argument of PlanMapper()
- **skydata** (*str, optional*) – matches name argument of SkyData.write()
- **ptres** (*float, optional*) – resolution for considering points duplicates, border generation (1/2) and add\_grid(). updateable
- **rotation** (*float, optional*) – positive Z rotation for point grid alignment
- **zheight** (*float, optional*) – override calculated zheight

#### Returns

- *Scene*
- *PlanMapper*
- *SkyData*

**raytraverse.api.load\_lp** (*path, hasparent=True*)

**raytraverse.api.get\_integrator** (*scn, pm, srcname='suns', simtype='2comp', zonal=False, sunviewengine=None*)

## TUTORIALS

### 5.1 Directional Sampling Overview

(starting at 4:56:25)

#### 5.1.1 Transcript

##### 1. Title Slide

Hello, my name is Stephen Wasilewski and I am presenting some work I have prepared along with my co-authors. Raytraverse is a new method that guides the sampling process of a daylight simulation.

##### 2. The Daylight Simulation Process

To understand how this method can enhance the daylight simulation process, it is useful to view the process by parts.

##### 2.b

The model describes how geometry, materials, and light sources are represented.

##### 2.c

Sampling determines how the analysis dimensions are subdivided into discrete points to simulate.

##### 2.d

These views rays are solved for by a renderer, yielding a radiance or an irradiance value for each view ray.

##### 2.e

This output is evaluated according to some metric or otherwise preparing the data for interpretation.

##### 3. Assumptions

To make a viable workflow, each of these parts require (whether explicitly or implicitly) a number of assumptions that define the limitations and opportunities of the method. To explain this in practical terms, here are three examples of well known climate based modeling methods for visual comfort.

##### 4. CBDM Methods for Visual Comfort: Ev based

Illuminance based methods, including DGPs (simplified Daylight Glare Probability), limit the directional sampling resolution to a single sample per view direction in order to efficiently sample a larger number of positions and sky conditions throughout a space.

Unfortunately: Even if the employed rendering method perfectly captures the true Illuminance, as a model for discomfort glare it fails to account for scenes where the dominant driver of discomfort is contrast based or due to small bright sources in an otherwise dim scene.

##### 5. CBDM Methods for Visual Comfort: 3/5 Phase

The 3-phase and 5-phase methods focus on the model and render steps. These methods fix the implementations of the material and sky models by discretizing the transmitting materials and sky dome in order to replace some steps of the rendering process with a matrix multiplication.

## **6. CBDM Methods for Visual Comfort: eDGPs**

Like the 5-phase method, The enhanced-simplified daylight glare probability method, developed to overcome the limitations of illuminance only metrics, uses separate sampling and rendering assumptions for the indirect contribution and direct view rays. The adaptation level is captured by an illuminance value, but glare sources are identified with an image calculated for direct view ray contributions only.

## **7. Existing Options For Sampling a Point**

In all of these methods, the sampling is treated as a fixed assumption.

### **7.b**

Either directional sampling is directly integrated into an illuminance by the renderer,

### **7.c**

or a high resolution image is generated.

### **7.d**

This is because at intermediate image resolutions the accuracy of the results can be worse than an illuminance sample, and are unreliable for capturing contrast effects due to small sources.

### **7.e**

So unlike sampling positions or timesteps which can be set at arbitrary spacing and easily tuned to the needs of the analysis, directional sampling is much more of an all or nothing choice; where the additional insights offered by an image can require 1 million times more data than a point sample. But is this really necessary?

### **7.f**

Whether through direct image interpretation or any of the commonly used glare metrics, the critical information embedded in an HDR image is usually simplified to a small set of sources and background, each with a size, direction and intensity. We cannot directly sample this small set of rays because we do not know these important directions ahead of time, but how close can we get?

### **7.g**

The raytraverse method provides a means to bridge the gap between point samples and high resolution images, allowing for a tunable tradeoff between simulation time and accuracy.

Our approach is structured by a wavelet space representation of the directional sampling. It works by applying a set of filters to an image to locate these important details.

## **8. Wavelet Decomposition**

To match our sampling space, we apply these filters to a square image space based on the Shirley-Chiu disk to square transform, which preserves adjacency and area, both necessary for locating true details.

### **8.b**

For each level of the decomposition, The high pass filters, applied across each axis (vertical, horizontal, and in combination) isolate the detail in the image, and the low pass filter performs an averaging yielding an image of half the size. This process is repeated, applying the high pass filters to the approximation, down to some base resolution. Each level of the decomposition stores the relative change in intensity at a particular resolution (or frequency).

### **8.c**

The total size of the output arrays is the same as the original, and can be used to perfectly recover the original signal through the inverse transform.

The benefit to compression comes from the fact that the magnitude of the detail coefficients effectively rank the data in terms of their contribution to the reconstruction. By thresholding the coefficients, less important data can be discarded.

#### 8.d

Even after discarding over 99% of the wavelet coefficients, the main image details are recoverable and only some minor artifacts have been introduced.

This property, that the wavelet coefficients rank the importance of samples at given resolutions, makes detail coefficients useful for guiding the sampling of view rays from a point.

### 9. Reconstruction Through Sampling

This process works as follows:

Beginning with a low resolution initial sampling the large scale features of the scene are captured.

Mimicking the wavelet transform, We apply a set of filters to this estimate and then use the resulting detail coefficients both to find an appropriate number of samples, and as probability distribution for the direction of these samples.

The new sample results returned by the renderer are used to update the estimate, which is lifted to a higher resolution.

This process is repeated up to a maximum resolution, equivalent to (or higher than) what a full resolution image might be rendered at.

### 10. Component Sampling

There are some cases where the wavelet based sampling will not find important details, such as specular views and reflections of the direct sun. Fortunately, because our method uses sky-patch coefficients to efficiently capture arbitrary sky conditions (similar to 3 phase and others), we can structure the simulation process in such a way to compensate for these misses. I refer you to our paper for details on how this works.

### 11. Results

Instead, I'll spend my remaining time sharing a few examples of scenes captured with: our approach, a high resolution reference and a matching uniform resolution image to demonstrate the benefits of variable sampling.

In addition to image reconstructions, the relative deviation from the reference is shown for vertical illuminance (characterizing energy conservation) and UGR (Unified Glare Rating, characterizing contrast), relative errors greater than 10% are highlighted in red.

This very glary scene highlights the different paths that light takes from the sun to the eye, including direct views, rough specular and diffuse reflections of the sun and sky. While the deviation in the low resolution image is unlikely to change a prediction in this case, the large errors show a failure case for uniform low-res sampling.

#### 11.b

A more complex, but also more likely scenario is that roller shades will be closed. While there are open questions on how to evaluate the specular transmission of such materials, raytraverse does not introduce any substantial new errors to this process.

#### 11.c

Raytraverse performs similarly well for partially open venetian blinds.

11.d Including deeper in a space where the floor reflection dominates.

#### 11.e

Raytraverse, without virtual sources or other rendering tricks, handles the case of specular reflections of the direct sun, a difficult problem for low resolution sampling.

#### 11.f

One case that we would expect raytraverse to struggle with would be a high frequency pattern like the dot frit shown here. And while the sampling does miss parts of the pattern, especially the lower contrast areas, enough of the detail is caught to meaningfully understand the image and, because of the direct sun view sampling, maintains high accuracy.

#### 11.g

In cases where more image fidelity is desired, raytraverse can be tuned to increase the sampling rate with a proportional increase in simulation time, but in our paper we show that the low sampling rates previously shown achieve a high level of accuracy for field of view metrics.

## 12. Thank you

Thank you for watching my presentation.

## 5.2 History

### 5.2.1 1.2.4 (2021-12-03) (not posted until 2022-02-10)

- organized command line code
- use process pool for sun sampler when raytracing is fast (such as -ab 0 runs with dcomp)
- propagate plotp to child sampler if sampling one level
- separated utility command line to own entry point. fixed ambiguity in coordinate handedness of some functions (changed kwarg defaults)

### 5.2.2 1.2.3 (2021-09-03)

- fixed rcontrib to work with Radiance/HEAD, radiance version string includes commit
- daylightplane - add indirect to -ab 0 sun run (daysim/5-phase style)
- lightpointkd - handle adding points with same sample rays
- sampler - add repeat function to follow an existing sampling scheme
- lightresult - added print function
- scene - remove logging from scene class
- **cli.py**
  - new command imgmetric, extract rays from image and use same metricfuncs
  - new command pull, filter and output 2d data frames from lightresult
  - add printdata option to suns, to see candidates or border
- make TStqdm progress bar class public
- **include PositionIndex calculation in BaseMetricSet**
  - new metrics: loggcr and position weighted luminance/gcr
- skymapper: filter candidates by positive dirnorm when initialized with epw/wea
- **imagetools: parallel process image metrics, also normalize peak with some** assumptions
- lightresult: accept slices for findices argument
- **sunsamplerpt: at second and third sampling levels supplement sampling with** spec\_guide at 1/100 the threshold. helps with interior spaces to find smaller patches of sun
- positionindex: fix bug transcribed from evalglare with the positionindex below horizon

### 5.2.3 1.2.0/2 (2021-05-24)

- command line interface development

### 5.2.4 1.1.2 (2021-02-19)

- improved documentation

### 5.2.5 1.1.0/1 (2021-02-10)

- refactor code to operate on a single point at a time

### 5.2.6 1.0.4 (2020-11-18)

- create and manage log file (attribute of Scene) for run directories
- possible fix for bug in interpolate\_kd resulting in index range errors
- protect imports in cli.py so documentation can be built without installing

### 5.2.7 1.0.3 (2020-11-10)

- new module for calculating position based on retinal features
- view specifications for directview plotting
- options for samples/weight visibility on directview plotting

### 5.2.8 0.2.0 (2020-09-25)

- Build now includes all radiance dependencies to setup multi-platform testing
- In the absence of raytraverse, sampler falls back to SPRenderer
- install process streamlined for developer mode
- travis ci deploys linux and mac wheels directly to pypi
- **release.sh should be run after updating this file, tests pass locally and docs build.**

### 5.2.9 0.1.0 (2020-05-19)

- First release on PyPI.

## 5.3 Index

## ACKNOWLEDGEMENTS

Thanks to additional project collaborators and advisors Marilyne Andersen, Lars Grobe, Roland Schregle, Jan Wienold, and Stephen Wittkopf

This software development was financially supported by the Swiss National Science Foundation as part of the ongoing research project “Light fields in climate-based daylight modeling for spatio-temporal glare assessment” ([SNSF #179067](#)).

## SOFTWARE CREDITS

- Raytraverse uses [Radiance](#)
- As well as all packages listed in the requirements.txt file, raytraverse relies heavily on the Python packages [numpy](#), [scipy](#), and for key parts of the implementation.
- C++ bindings, including exposing core radiance functions as methods to the renderer classes are made with [pybind11](#)
- Installation and building from source uses [cmake](#) and [scikit-build](#)
- This package was created with [Cookiecutter](#) and the [audreyr/cookiecutter-pypackage](#) project template.

## PYTHON MODULE INDEX
